GENERAL TROUBLESHOOTING INFORMATION

HOW TO CHECK FOR DTCS WITH THE HDS

1. Make sure the ignition switch is in LOCK(O).
2. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

Fig. 2: Connecting HDS To DLC

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II).
4. Make sure the HDS communicates with the vehicle and the AcuraLink control unit (XM receiver). If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select XM/HIP in the BODY ELECTRICAL menu.
6. Select DTCs in the XM/HIP menu.
7. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated **DTC TROUBLESHOOTING**. If no DTCs are indicated, refer to **SYMPTOM TROUBLESHOOTING**.

NOTE: After troubleshooting, clear the DTCs with the HDS.

DELETING THE ACURALINK MESSAGES (WITH THE HDS)

To delete all messages including Recall and Diagnostic Info:

1. Connect the HDS to the data link connector (DLC).
2. Using the HDS, go to the BODY ELECTRICAL menu, select XM/HIP, then select HIP RESET menu, select DTC Log Data Clear and follow the HDS on screen instructions.

DELETING THE ACURALINK MESSAGES (WITHOUT HDS) (TO DELETE A SINGLE MESSAGE)

NOTE: Diagnostic info and recall/campaign messages can only be deleted with HDS.

1. Press the INFO button to bring up the Information screen.
2. Scroll to the Message option, then select it by pressing ENTER on the interface selector.
3. Select the message category that contains the message you want to delete.
4. Use the interface knob to scroll up or down to the message title you want to delete, and select it by pressing ENTER on the interface selector.
5. Scroll to Delete with the interface knob, and select it by pressing ENTER on the interface selector.

DELETING THE ACURALINK MESSAGES (WITHOUT HDS) (TO DELETE ALL MESSAGE)

NOTE: **The Delete All Messages command does not apply to Diagnostic Info and Recall messages. They can only be deleted with HDS.**

1. Press the SETUP button to view the setup screen.
2. Select MORE by pushing the interface selector to the right.
3. Use the interface knob to scroll to the AcuraLink/Messages button, and select it by pressing ENTER on the interface selector.
4. Scroll to the Delete Messages option, and select it by pressing ENTER on the interface selector.
5. Scroll to the category with the messages you want to delete, and select the category by pressing ENTER on the interface selector.

ACURALINK CONTROL UNIT UPDATING

Special tools required

- GNA600 kit and an iN workstation with AcuraLink update software
- 256MB PCMCIA Memory Card
- AcuraLink Reprogramming Cable
- AcuraLink Reprogramming Cable Adapter

- NOTE:**
- **Whenever you install a new AcuraLink control unit, you must update the control unit with the latest software.**
 - **The GNA600 is the only tool currently available to update the AcuraLink control unit.**
 - **If you are updating a control unit in a new vehicle, make sure all the fuses are installed.**
 - **Make sure the in workstation has the latest HDS software installed. (The AcuraLink update software is contained in the HDS update CD.)**
 - **The update may take up to 60 minutes.**
 - **You cannot update an AcuraLink control unit with its current or previous software versions. It will only accept a new software version.**
 - **Before you update the AcuraLink control unit, test the vehicle battery (see**

BATTERY TEST), and only proceed if the results are good. Make sure the battery is connected to a battery booster (not a battery charger) while updating the control unit. If the battery is not in good condition, or it dies during the updating procedure, you may damage the AcuraLink control unit.

- If you encounter errors in the software, follow the on-screen instructions, or if necessary, reboot the workstation, and try again.
- There are five process involved in updating the AcuraLink control unit:
 - Setting up the GNA600
 - Capturing the current program ID from the AcuraLink control unit
 - Download the new software to the GNA600
 - Update the software in the vehicle's AcuraLink control unit
 - Confirm the AcuraLink self-diagnosis
- Do the update with the ignition switch turned to LOCK (0).
- To prevent damage to the AcuraLink control unit, do not operate anything electrical (brakes, head lights, etc.) during the update.
- Check any official Honda service website for more service information about updating the AcuraLink control unit.
- To update the AcuraLink control unit, you must connect the GNA600 to the AcuraLink connector (A), not the DLC.
- Before you update an AcuraLink control unit, read the procedure. The order of connecting and disconnecting connectors is critical, and some steps must be done within a specified period of time. If the steps are not followed exactly, you may have to repeat the procedure from the start, and in some cases, you may damage the GNA600 or the AcuraLink control unit.

Fig. 3: Identifying Acuralink Control Unit
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Make sure the ignition switch is turned to LOCK (0).
2. Remove the right rear side trim panel (see **TRIM REMOVAL/INSTALLATION - REAR SIDE AREA**).
3. Launch the AcuraLink Update program and follow the on-screen instructions to complete the update.

NOTE:

- If the software in the AcuraLink control unit is the latest, disconnect the update tool from the AcuraLink connector.
- If the update is part of a troubleshooting or a repair procedure, return to that procedure and continue troubleshoot or repairing the vehicle.

SYMPTOM TROUBLESHOOTING INDEX

SYMPTOM TROUBLESHOOTING CHART

Symptom	Diagnostic procedure	Also check for
AcuraLink service application does not work	Symptom Troubleshooting (see <u>ACURALINK SERVICE APPLICATION DOES NOT WORK</u>)	• Blown fuse No. 21 (7.5 A) and No. 32 (10 A) in the under-dash fuse/relay box • Poor ground at G606
		• Call Acura Client Services and request an activation.

AcuraLink services do not work after replacing the AcuraLink control unit (XM receiver)	Navigation System Symptom Troubleshooting (see <u>SYMPTOM TROUBLESHOOTING</u>)	• Call XM client care and register the replacement AcuraLink control unit (XM receiver). • The client must have an active XM account. Try several XM stations. If only channels 000,001, 174, and 247 can be tuned, the account is inactive, or there is a problem with the AcuraLink control unit (XM receiver).
---	--	--

SYSTEM DESCRIPTION

The AcuraLink uses the client's cell phone or XM radio to transmit and receive information about the vehicle. In addition, the AcuraLink system has a Text-To-Speech engine, and will also have the capability to initiate voice or data calls with the HandsFreeLink control unit.

The AcuraLink control unit (HIP) is very similar in design to an XM receiver that has additional communication features. The main functions include:

- Receiving and playing XM stations. Displays station, song title and other information on the audio unit using the GA-Net bus.
- Receiving XM traffic channel data.
- Gives Feature Guide tips.
- Receiving AcuraLink messages and displaying them in the navigation display.
- Processing DTC (diagnostic trouble code) error messages from the PCM, the SRS and other systems and displaying them on the navigation display.
- Sending DTC information to the AcuraLink servers using the client's cell phone (only if client has set up and enabled this option).

Fig. 4: Acuralink System Description

Service Application

- Malfunction indicator lamp (MIL) explanation (from server message and vehicle message)
- Service information message
- Recall Information
- Quick tips
- Place to provide feedback/view cautions that were not available when vehicle was initially sold
- Correction of address and full name that is registered
- Real time traffic information
- Maintenance information message
- Feature guide (90 days)

SELF-DIAGNOSTIC FUNCTION

NOTE: Only select DATA RESET from the XM (HIP) ECU screen when instructed. Selecting DATA RESET will clear the AcuraLink registration, and the AcuraLink service will reset to the factory default. If the vehicle was already registered for the AcuraLink service, it will have to be reactivated by calling Acura Client Services before all features will be available.

The AcuraLink control unit (XM receiver) has a self-diagnostic function. To run the self-diagnostic function, do

the following:

HOW TO ENTER THE SELF-DIAGNOSTIC FUNCTION

NOTE: Always check for and repair any B-CAN or F-CAN DTCs before troubleshooting the AcuraLink system.

1. Turn the ignition switch to ON (II).
2. Press the interface dial.
3. Press and hold the MAP/GUIDE, CANCEL, and MENU buttons at the same time for 3 seconds more, and the self-diagnosis begins.

Fig. 8: Identifying MAP/GUIDE, CANCEL And MENU Buttons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Using interface dial, select the NAVI System from the Select Diagnosis Items menu. Press the interface dial. The display indicates NAVI System Link, and will perform a Navi connection check for each device. If a connection is faulty, the place where it is faulty will be indicated with NG (red color). If the XM (HIP) indicator is NG (red color), go to step 5.

Fig. 9: Identifying Acura Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using the interface dial, select the Return from the Navi System Link. Press the interface dial.

6. Using the interface dial, select the XM (HIP) from the Select Diagnosis Items menu. Press the interface dial.

Fig. 10: Diagnosis Screen Display - XM (HIP)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Using the interface dial, select the XM (HIP) System Link from the XM (HIP) menu. Press the interface dial. The display indicates XM (HIP) System Link, and will do an AcuraLink connection check for each device. If a connection is faulty, the place where it is faulty will be indicated with NG (red color).

NOTE: If the XM antenna connection condition is faulty, XM ANTENNA is indicated on the audio-HVAC sub display-clock.			

- If the indication does not go away, confirm DTCs, and refer to the relevant system troubleshooting and input tests.

Canceling the Self-diagnostic Function

- Use the interface dial to, select the Exit Diag. Press the interface dial to cancel the self-diagnostic function.

DTC TROUBLESHOOTING

DTC B2202: ACURALINK CONTROL UNIT EEPROM ERROR

NOTE: **Check the vehicle battery condition first.**

1. Connect the HDS to the DLC.
2. Turn the ignition switch to ON (II).
3. Check for DTCs with the HDS and DTC log data in the navigation system diagnostic mode (see **SYSTEM DIAGNOSTIC MODE**).

Is DTC B2202 indicated with HDS and on the navigation display?

YES - Intermittent failure. The system is OK at this time. Check for poor connections or loose terminals at the AcuraLink control unit (XM receiver).

NO - Check for poor connections or loose terminals at the AcuraLink control unit (XM receiver). If all connections are OK, replace the AcuraLink control unit (XM receiver) (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

DTC B2204: B-CAN COMMUNICATION LINE ERROR

NOTE:

- **If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).**
- **Check the vehicle battery condition first.**

1. Connect the HDS to the DLC.
2. Turn the ignition switch to ON (II).
3. Check for DTCs with the HDS and DTC log data in the navigation system diagnostic mode (see **SYSTEM DIAGNOSTIC MODE**).

Is DTC B2204 indicated with HDS and on the navigation display?

YES - Go to step 4.

NO - Intermittent failure. B-CAN communication line is OK at this time. Check for poor connections or loose terminals at the AcuraLink control unit (XM receiver).

4. Turn the ignition switch to LOCK (0).
5. Disconnect the AcuraLink control unit (XM receiver) connector B (16P) and gauge control module connector A (12P).
6. Check for continuity between the AcuraLink control unit (XM receiver) connector B (16P) No. 5 terminal and gauge control module connector A (12P) No. 5 terminal.

Wire side of female terminals

Fig. 13: Identifying Continuity Between Acuralink Control Unit B (16P) And Gauge Control Module A (12P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections or loose terminals at the AcuraLink control unit (XM receiver). If all connections are OK, replace the AcuraLink control unit (XM receiver) (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO - Repair open in the wire between AcuraLink control unit (XM receiver) and the gauge control module.

DTC B2205: F-CAN COMMUNICATION LINE ERROR

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**).
- Check the vehicle battery condition first.

1. Connect the HDS to the DLC.
2. Turn the ignition switch to ON (II).
3. Check for DTCs with the HDS and DTC log data in the navigation system diagnostic mode (see **SYSTEM DIAGNOSTIC MODE**).

Is DTC B2205 indicated with HDS and on the navigation display?

YES - Go to step 4.

NO - Intermittent failure. F-CAN communication line is OK at this time. Check for poor connections or loose terminals at the AcuraLink control unit (XM receiver).

4. Turn the ignition switch to LOCK (0).
5. Disconnect the AcuraLink control unit (XM receiver) connector B (16P) and gauge control module connector A (12P).
6. Check for continuity between the AcuraLink control unit (XM receiver) connector B (16P) No. 6, No. 16 terminals and gauge control module connector A (12P) No. 6, No. 12 terminals.

Fig. 14: Identifying Continuity Between Acuralink Control Unit B (16P) And Gauge Control Module Connector A (12P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections or loose terminals at the AcuraLink control unit (XM receiver). If all connections are OK, update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO - Repair open in the wire between AcuraLink control unit (XM receiver) and the gauge control module.

DTC B2207: NAVIGATION UNIT LOST COMMUNICATION WITH ACURALINK CONTROL UNIT

NOTE: Check the vehicle battery condition first.

1. Connect the HDS to the DLC.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it ON (II) and wait 30 seconds or more.
4. Check for DTCs with the HDS.

Is DTC B2207, B2208 indicated?

YES - Check the battery condition (see **BATTERY TEST**). If the system OK, replace the AcuraLink

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT AcuraLink - MDX

control unit (XM receiver).

NO -

- If only B2207 is indicated, go to step 5.
- If only B2208 is indicated, refer to the **DTC B2208: HandsFreeLink Control Unit Lost Communication with AcuraLink Control Unit** .

5. Turn the ignition switch to LOCK (0).
6. Disconnect the AcuraLink control unit (XM receiver) connector A (20P) and navigation unit connector F (5P).
7. Check for continuity between the following terminals of the AcuraLink control unit (XM receiver) connector A (20P) and navigation unit connector F (5P) according to the table.

CONNECTOR TERMINAL REFERENCE

AcuraLink control unit (XM receiver) connector A (20P)	Navigation unit connector F (5P)	Wire color
A3	F1	WHT
A4	F3	GRIM
A13	F2	RED
A14	F4	BLK
A15	F5	BRN

NAVIGATION UNIT CONNECTOR F (5P)

Wire side of female terminals

Fig. 16: Identifying Navigation Unit Connector F (5P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to Step 8.

NO - Repair open in the wire(s) between AcuraLink control unit (XM receiver) and the navigation unit.

8. Check for continuity between body ground and AcuraLink control unit (XM receiver) connector A (20P) No. 3,4,13 and 14 terminals individually.

Fig. 17: Identifying Continuity Between Body Ground And Acuralink Control Unit (XM Receiver) Connector A (20P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between the AcuraLink control unit (XM receiver) and the navigation unit.

NO - Go to Step 9.

9. Check for continuity between the terminals of AcuraLink control unit (XM receiver) connector A (20P) as follows.

CONNECTOR TERMINAL REFERENCE

From terminal	To terminals
A3	A4, A13, A14, A15
A4	A13, A14, A15
A13	A14, A15
A14	A15

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between the AcuraLink control unit (XM receiver) and the navigation unit (replace the appropriate shielded harness).

NO - Go to Step 10.

10. Turn the ignition switch to ON (II), and measure the same terminals for voltage.

Fig. 18: Identifying Voltage Between Body Ground And Acuralink Control Unit (XM Receiver) Connector A (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair short to power in the wire(s) between the AcuraLink control unit (XM receiver) and the navigation unit.

NO - Go to Step 11.

11. Turn the ignition switch to LOCK (0).
12. Reconnect the Acuralink control unit(XM receiver) connector A (20P).
13. Measure the resistance between AcuraLink control unit (XM receiver) connector A (20P) No. 3, No. 4, and No. 13, No. 14 terminals.

Fig. 19: Identifying Resistance Between Acuralink Control Unit (XM Receiver) Connector A (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than about 100k ohms?

YES - AcuraLink control unit (XM receiver) is faulty, update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see

ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION).

NO - Go to Step 15.

14. Reconnect the navigation unit connector F (5P).
15. Turn the ignition switch to ON (II).
16. Measure the voltage between the body ground and the AcuraLink control unit (XM receiver) connector A (20P) No. 3, No. 4 terminals individually.

**ACURALINK CONTROL UNIT (XM RECEIVER)
CONNECTOR A (20P)**

Fig. 20: Identifying Voltage Between Body Ground And Acuralink Control Unit (Xm Receiver) Connector A (20P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than about 3.5V?

YES - AcuraLink control unit (XM receiver) is faulty, update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION).**

NO - Navigation unit is faulty, replace the navigation unit.

DTC B2208: HANDSFREELINK CONTROL UNIT LOST COMMUNICATION WITH ACURALINK CONTROL UNIT

NOTE: Check the vehicle battery condition first.

1. Connect the HDS to the DLC.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it ON (II) and wait 30 seconds or more.
4. Check for DTC with the HDS.

Is DTC B2207, B2208 indicated?

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT AcuraLink - MDX

YES - Check the battery condition (see **BATTERY TEST**). If the system OK, replace the AcuraLink control unit (XM receiver).

NO -

- If only B2208 is indicated, go to step 5.
 - If only B2207 is indicated, refer to the **DTC B2207: Navigation Unit Lost Communication with AcuraLink Control Unit** .
5. Turn the ignition switch to LOCK (0).
 6. Disconnect the AcuraLink control unit (XM receiver) connector B (16P) and HandsFreeLink control unit 28P connector.
 7. Check for continuity between the following terminals of the AcuraLink control unit (XM receiver) connector B (16P) and HandsFreeLink control unit 28P connector according to the table.

CONNECTOR TERMINAL REFERENCE

AcuraLink control unit (XM receiver) connector B (16P)	HandsFreeLink control unit 28P connector	Wire color
B6	No. 24	BRN
B7	No. 9	GRN
B8	No. 22	RED
B15	No. 8	BLK
B16	No. 23	WHT

Wire side of female terminals

Fig. 22: Identifying HandsFreeLink Control Unit 28P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to Step 8.

NO - Repair open in the wire(s) between AcuraLink control unit (XM receiver) and the HandsFreeLink control unit.

8. Check for continuity between body ground and AcuraLink control unit (XM receiver) connector B (16P) No. 7, 8, 15 and 16 terminals individually.

Fig. 23: Identifying Continuity Between Body Ground And Acuralink Control Unit (XM Receiver) Connector B (16P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between the AcuraLink control unit (XM receiver) and the HandsFreeLink control unit.

NO - Go to Step 9.

9. Check for continuity between the terminals of AcuraLink control unit (XM receiver) connector B (16P) as follows.

CONNECTOR TERMINAL REFERENCE

From terminal	To terminals
B7	B8, B15, B16, B6
B8	B15, B16, B6
B15	B16, B6
B16	B6

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between the AcuraLink control unit (XM receiver) and the HandsFreeLink control unit (replace the appropriate shield harness).

NO - Go to Step 10.

10. Turn the ignition switch to ON (II) and check the same terminals for voltage.

Fig. 24: Identifying Voltage Between Body Ground And Acuralink Control Unit (XM Receiver) Connector B (16P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Repair short to power in the wire(s) between the AcuraLink control unit (XM receiver) and the HandsFreeLink control unit.

NO - Go to Step 11.

11. Turn the ignition switch to LOCK(0).
12. Reconnect the AcuraLink control unit (XM receiver) connector B (16P).
13. Measure the resistance between AcuraLink control unit (XM receiver) connector B (16P) No. 7, No. 8, and No. 15, No. 16 terminals.

Fig. 25: Identifying Resistance Between Acuralink Control Unit (XM Receiver) Connector B (16P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than about 100k ohms?

YES - AcuraLink control unit (XM receiver) is faulty, replace the AcuraLink control unit (XM receiver).

NO - Go to Step 14.

14. Reconnect the HandsFreeLink control unit 22P connector.
15. Turn the ignition switch to ON (II).
16. Measure the voltage between the body ground and the AcuraLink control unit (XM receiver) connector B (16P) No. 7, No. 8 terminals individually.

Fig. 26: Identifying Voltage Between Body Ground And Acuralink Control Unit (XM Receiver) Connector B (16P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than about 3.5V?

YES - AcuraLink control unit (XM receiver) is faulty, update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO - HandsFreeLink control unit is faulty, replace the HandsFreeLink control unit.

DTC B2209: ACURALINK CONTROL UNIT INTERNAL ERROR

NOTE: Check the vehicle battery condition first.

1. Connect the HDS to the DLC.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it ON (II) and wait 30 seconds or more.
4. Check for DTC with the HDS.

Is DTC B2209 indicated?

YES - AcuraLink control unit (XM receiver) is faulty, replace the AcuraLink control unit (XM receiver).

NO - Intermittent failure, AcuraLink control unit (XM receiver) is OK at this time.

DTC B2240: XM ANTENNA ERROR

NOTE: **Check the vehicle battery condition first.**

1. Connect the HDS to the DLC.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it ON (II) and wait 30 seconds or more.
4. Check for DTC with the HDS.

Is DTC B2240 indicated?

YES - Go to Step 5.

NO - Intermittent failure, XM antenna is OK at this time. Check for poor connections or loose terminals at the AcuraLink control unit(XM receiver) and XM antenna.

5. Check the XM antenna lead connection at the AcuraLink control unit (XM receiver) and at the XM antenna.

Is it connected properly?

YES - Go to Step 6.

NO - Reconnect the connector, and recheck the DTC.

6. Turn the ignition switch to LOCK (0).
7. Disconnect the AcuraLink control unit(XM receiver) connector C (2P).
8. Turn the ignition switch to ON (II).
9. Measure the voltage between the body ground and the AcuraLink control unit (XM receiver) terminal C (2P) No. 1 terminal.

**ACURALINK CONTROL UNIT (XM RECEIVER)
TERMINAL C (2P)**

Terminal side of male terminals

Fig. 27: Identifying Voltage Between Body Ground And Acuralink Control Unit (XM Receiver) Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 4.5 V?

YES - Go to Step 10.

NO - AcuraLink control unit (XM receiver) is faulty, Update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

10. Turn the ignition switch to LOCK (0).
11. Disconnect the XM antenna 2P connector.
12. Check for continuity between body ground and XM antenna 2P connector No. 1 terminal.

XM ANTENNA 2P CONNECTOR

**Fig. 28: Identifying Continuity Between Body Ground And XM Antenna 2P Connector Terminal 1**
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the antenna lead between the AcuraLink control unit (XM receiver) and XM antenna.

NO - Go to Step 13.

13. Check for continuity between XM antenna 2P connector terminal No. 1 and No. 2 (outside of the lead).

XM ANTENNA 2P CONNECTOR

Fig. 29: Identifying Continuity Between XM Antenna 2P Connector Terminal 1 And 2 (Outside Of Lead)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the antenna lead between the AcuraLink control unit (XM receiver) and XM antenna.

NO - Go to Step 14.

14. Reconnect the AcuraLink control unit C(2P) connector.
15. Turn the ignition switch to ON (II).
16. Measure the voltage between the body ground and the XM antenna 2P connector No. 1 terminal.

XM ANTENNA 2P CONNECTOR

Fig. 30: Identifying Voltage Between Body Ground And XM Antenna 2P Connector Terminal 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 4.5V?

YES - XM antenna is faulty, replace the XM antenna.

NO - Replace the antenna lead between the AcuraLink control unit (XM receiver) and the XM antenna.

SYMPTOM TROUBLESHOOTING

ACURALINK SERVICES DOES NOT WORK

NOTE:

- In order for the AcuraLink service to work, the client must have an activated account with XM (receives all channels).
- Check the vehicle battery condition first.
- If you can only tune to channel 000,001,174, and 247, make sure that the audio unit is set to the channel mode (see owner's manual). If it is set to the channel mode, call XM radio customer support and check the account activation status.

1. Call Acura Client Services and verify the unit status. Request ACS to send an activation signal to the vehicle. Park the vehicle outside, and let the vehicle idle for about an hour.

Does the AcuraLink service application work?

YES - The vehicle is OK at this time.

NO - Go to step 2.

2. Check the No. 21 (7.5 A) fuse and No. 32 (10 A) fuse in the under-dash fuse/relay box.

Are the fuses OK?

YES - Go to step 3.

NO - Replace the fuse(s), and recheck.

3. Turn the ignition switch to ACC (I).
4. Measure the voltage between the No. 2 terminal of the AcuraLink control unit (XM receiver) connector A (20P) and body ground.

Wire side of female terminals

Fig. 31: Identifying Voltage Between Acuralink Control Unit (XM Receiver) Connector A (20P) Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 5.

NO - Repair open in the wire(s) between the AcuraLink control unit and the No. 32 (10 A) fuse in the under-dash fuse/relay box.

5. Turn the ignition switch to ON (II).
6. Measure the voltage between the No. 12 terminal of the AcuraLink control unit (XM receiver) connector A (20P) and body ground.

**ACURALINK CONTROL UNIT (XM RECEIVER)
CONNECTOR A (20P)**

Wire side of female terminals

Fig. 32: Identifying Voltage Between Acuralink Control Unit (XM Receiver) Connector A (20P) Terminal 12 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Repair open in the wire(s) between the AcuraLink control unit (XM receiver) and the No. 21 (7.5 A) fuse in the under-dash fuse/relay box.

7. Turn the ignition switch to LOCK (0).
8. Measure the voltage between the No. 11 terminal of the AcuraLink control unit (XM receiver) connector A (20P) and body ground.

**ACURALINK CONTROL UNIT (XM RECEIVER)
CONNECTOR A (20P)**

Wire side of female terminals

Fig. 33: Identifying Voltage Between Acuralink Control Unit (XM Receiver) Connector A (20P) Terminal 11 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.5 V?

YES - Check for loose wires or poor connections at the AcuraLink control unit (XM receiver) connector A (20P). If the connections are good, substitute a known-good AcuraLink control unit (XM receiver), and recheck. If the symptom goes away, Update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO - Check for an open in the wire between the AcuraLink control unit (XM receiver) and body ground. If the wire is OK, check for poor ground at G606 (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

2008 ENGINE PERFORMANCE

Advanced Diagnostics - MDX

DTC P0101 (50): ADVANCED DIAGNOSTICS

DTC P0101: MASS AIRFLOW (MAF) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

Outline of Engine System Structure

P0101-0774

Fig. 1: Mass Airflow (MAF) Sensor - System Diagram

Actual Intake Airflow versus Presumed Intake Airflow

P0101-0371

Fig. 2: Mass Airflow (MAF) Sensor Graph**General Description**

The mass airflow (MAF) sensor directly measures the amount of intake airflow into the engine, and the powertrain control module (PCM) controls the fuel injection based on the measured value. The manifold absolute pressure (MAP) sensor measures the intake manifold pressure and the PCM calculates the amount of intake airflow from the MAP sensor output and the engine revolutions.

The PCM compares the MAF sensor output (amount of intake airflow) and the amount of intake airflow calculated from MAP sensor output. If their difference is too large (in the malfunction area), the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions**ENABLE CONDITIONS CHART**

Condition	Minimum	Maximum

Elapsed time after starting the engine	5 seconds	-
Engine coolant temperature	156°F (69°C)	-
Engine speed	650 rpm	2,100 rpm
No active DTCs	P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0171, P0172, P0174, P0175, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0340, P0341, P0344, P0401, P0404, P0443, P0496, P0497, P0506, P0507, P1128, P1129, P145C, P2413, P2646, P2647, P2648, P2649	

Malfunction Threshold

The difference between the amount of intake air measured by the MAF sensor and the amount of intake air calculated from the MAP sensor output is out of the normal area for at least 10 seconds.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0102 (50): ADVANCED DIAGNOSTICS

DTC P0102: MASS AIRFLOW (MAF) SENSOR CIRCUIT LOW VOLTAGE

P0101-0602

Fig. 3: Mass Airflow (MAF) Sensor (Low Voltage) - Circuit Diagram

P0102-0370

Fig. 4: Mass Airflow (MAF) Sensor Voltage Graph

General Description

The mass airflow (MAF) sensor is attached to the intake air passage, and it measures the amount of intake airflow. The MAF sensor is a hot wire airflow meter. The airflow cools the electrically heated wire that is

mounted in the air passage. The powertrain control module (PCM) determines the amount of intake airflow by detecting the current that is required to keep the hot wire at a constant temperature. The lower limit of the MAF sensor output is specified. If the output is below that limit, the PCM detects a malfunction and stores a DTC.

DTC P0111 (10): ADVANCED DIAGNOSTICS

DTC P0111: INTAKE AIR TEMPERATURE (IAT) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

Fig. 15: Intake Air Temperature (IAT) Sensor Performance Graph (1 Of 2)

P0111-0570

Fig. 16: Intake Air Temperature (IAT) Sensor Performance Graph (2 Of 2)

General Description

Two engine coolant temperature sensors and one intake air temperature sensor are used by the powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature. When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0116 (86): ADVANCED DIAGNOSTICS

DTC P0116: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT

RANGE/PERFORMANCE PROBLEM**Engine Coolant Temperature Sensor**

P0116-0570

Fig. 21: Engine Coolant Temperature (ECT) Sensor Performance Graph**General Description**

The powertrain control module (PCM) supplies voltage to the engine coolant temperature (ECT) signal circuit (about 5 V) through a pull-up resistor. As the engine coolant cools, ECT sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT output voltage after driving a set time after starting the engine does not reach a set temperature, or when the difference between the ECT output voltage when driving and the output voltage of the ECT after the engine is stopped a set time does not change a certain amount, the PCM detects a malfunction and a DTC is stored.

Others	With a completely cooled engine (one that has been off for at least 6 hours): Judgment is made after the engine has been run for at least 10 minutes, turned off for at least 10 seconds, then started and run again for at least 10 seconds.	
	With a partially cooled engine (one that has been off for less than 6 hours): Judgment is made after the engine has been run for at least 10 minutes, turned off for at least 150 minutes, then started and run again for at least 10 seconds.	

Malfunction Threshold

Malfunction determination 1:

With a completely cooled engine (one that has been off for at least 6 hours):

When the change in coolant temperature after 10 minutes or more of running time is 50°F (10°C) or less, a malfunction is detected.

Malfunction determination 2:

With a partially cooled engine (one that has been off for less than 6 hours):

When the difference between the coolant temperature after 10 minutes or more of running time minus the coolant temperature after the engine has been off for 150 minutes and then run for 10 seconds is 50°F (10°C) or less, a malfunction is detected.

Driving Pattern

- With a completely cooled engine (one that has been off for at least 6 hours).
 1. Start the engine, and let it idle for at least 10 minutes.
 2. Turn off the ignition for 10 seconds, then restart the engine and let it idle for at least 10 seconds.
- With a partially cooled engine (one that has been off for less than 6 hours).

1. Start the engine, and let it idle for at least 10 minutes.
2. Turn off the ignition for 150 minutes, then restart the engine and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0117 (6): ADVANCED DIAGNOSTICS

DTC P0117: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW VOLTAGE

P0116-0501

Fig. 22: Engine Coolant Temperature (ECT) Sensor 1 (Low Voltage) - Circuit Diagram

Fig. 23: Engine Coolant Temperature (ECT) Sensor Voltage Graph

General Description

Engine coolant temperature (ECT) sensor 1 is used for air/fuel ratio feedback control, ignition timing control, idle speed control, and other functions. The ECT sensor 1 resistance varies depending on the engine coolant temperature. As the engine coolant cools, the ECT sensor 1 resistance increases, and the powertrain control module (PCM) detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage is less than a set value when the engine coolant temperature is high, the PCM detects a malfunction and a DTC is stored.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0118 (6): ADVANCED DIAGNOSTICS

DTC P0118: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH VOLTAGE

P0118-0501

Fig. 24: Engine Coolant Temperature (ECT) Sensor 1 (High Voltage) - Circuit Diagram

P0118-0571

Fig. 25: Engine Coolant Temperature (ECT) Sensor Voltage Graph

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

General Description

Engine coolant temperature (ECT) sensor 1 is used for air/fuel ratio feedback control, ignition timing control, idle speed control, and other functions. The ECT sensor 1 resistance varies depending on the engine coolant temperature. As the engine coolant cools, the ECT sensor 1 resistance increases, and the powertrain control module (PCM) detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage. If the ECT sensor 1 output voltage is more than a set value when the engine coolant temperature is low, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	
Ignition switch	ON
No active DTCs	P0117

Malfunction Threshold

The ECT sensor 1 output voltage is 4.92 V or more for at least 2 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0122 (7): ADVANCED DIAGNOSTICS

DTC P0122: THROTTLE POSITION (TP) SENSOR A CIRCUIT LOW VOLTAGE

P0122-0503

Fig. 26: Throttle Position (TP) Sensor A (Low Voltage) - Circuit Diagram**General Description**

Throttle position (TP) sensor A is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position.

The throttle valve position signal from TP sensor A is transmitted to the powertrain control module (PCM) for target position feedback control.

If the signal from TP sensor A is less than a fixed value for a set time, the PCM detects a TP sensor A malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Continuous
Sequence	None
Duration	0.2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	
Ignition switch	ON
No active DTCs	P0123, P2101, P2118, P2135, P2176

Malfunction Threshold

The TP sensor A output voltage is 0.3 V or less for at least 0.2 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0125 (86): ADVANCED DIAGNOSTICS

DTC P0125: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 MALFUNCTION/SLOW RESPONSE

Fig. 27: Engine Coolant Temperature (ECT) Sensor Voltage Graph

General Description

The powertrain control module (PCM) supplies voltage to the engine coolant temperature (ECT) signal circuit

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

(about 5 V) through a pull-up resistor. As the engine coolant cools, the ECT sensor 1 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the ECT sensor 1 resistance decreases, and the PCM detects a low signal voltage.

If the ECT sensor 1 output voltage does not reach a specified temperature at which closed-loop control for stoichiometric air/fuel ratio starts within a set time, depending on the initial coolant temperature after starting the engine, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	20 minutes or less
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Initial engine coolant temperature	-	10°F (-12°C)
Fuel feedback	Other than during fuel cut-off operation	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0117, P0118, P0134, P0135, P0154, P0155, P0171, P0172, P0174, P0175, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0340, P0344, P0401, P0404, P0443, P0496, P0497, P0506, P0507, P0627, P1077, P1078, P1128, P1129, P1172, P1174, P145C, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2413, P2646, P2647, P2648, P2649	

Malfunction Threshold

The engine running time before the engine coolant temperature reaches 10°F (-12°C), based on the initial engine coolant temperatures, is as follows.

MALFUNCTION THRESHOLD CHART

Initial engine coolant temperature	-24°F (-31°C)	10°F (-12°C)
Engine running time	300 seconds or more	60 seconds or more

Driving Pattern

1. Start the engine at an initial engine coolant temperature as specified under Enable Conditions.
2. Let the engine idle for at least 20 minutes.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0128 (87): ADVANCED DIAGNOSTICS

DTC P0128: COOLING SYSTEM MALFUNCTION

Fig. 28: Cooling System Operation Graph (1 Of 2)

Engine Coolant Temperature of Radiator (ECT 2)

P0128-0570

Fig. 29: Cooling System Operation Graph (2 Of 2)**General Description**

The thermostat is closed when the engine coolant temperature is low, and it stops the circulation of engine coolant to speed engine warm up. When the engine coolant temperature increases, the thermostat opens and circulates engine coolant to control its temperature. When the engine coolant temperature decreases, the opening area of the thermostat is reduced to regulate the engine coolant temperature. If the thermostat sticks open, engine warm up is delayed, and exhaust emissions are adversely affected. The powertrain control module (PCM) measures the rise in the coolant temperature after the engine starts using engine coolant temperature (ECT) sensors 1/2, and it estimates the characteristics of the engine coolant temperature by calculations based on those two temperatures and the driving conditions. When ECT 2 immediately increases from the starting value, it is defined as the thermostat stuck open. When ECT 2 does not increase to the specified value, it is defined as a thermostat malfunction.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Once per driving cycle
Sequence	None
Duration	Depending on driving conditions
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

(1) Intake air temperature decrease judgement when there is no driving record of 25 mph (40 km/h) in this drive cycle.		
(2) Intake air temperature decrease judgement when there is a driving record of 25 mph (40 km/h) in this drive cycle.		

Malfunction Threshold

Malfunction determination 1:

If the difference between the current measured coolant temperature at the radiator (ECT 2) and the initial coolant temperature at the radiator (ECT 2) is at least 21°F (12°C) when the calculated coolant temperature at the engine (ECT 1) reaches 159°F (71°C), a malfunction is detected (thermostat stuck open); or if the coolant temperature at the radiator (ECT 2) only reaches 68°F (20°C), a malfunction is detected (thermostat malfunction).

Malfunction determination 2:

When the calculated engine coolant temperature (ECT 1) reaches 158°F (70°C) before the measured engine coolant temperature (ECT 1) reaches 158°F (70°C), a malfunction is detected.

Driving Pattern

1. Start the engine under the conditions specified under Enable Conditions.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 10 minutes.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0133 (157): ADVANCED DIAGNOSTICS

DTC P0133: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) CIRCUIT SLOW RESPONSE

P0133-0570

Fig. 30: Rear Air/Fuel Ratio (A/F) Sensor (Bank 1, Sensor 1) (Slow Response) - Communication Diagram

General Description

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the rear A/F sensor

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

output voltage and uses fuel feedback control to improve exhaust emissions. The PCM measures the response characteristics against the rear A/F sensor output, and if the average inversion cycle time is less than the specified value, it detects a deteriorated response and stores a DTC.

Others		Without excessive load change	

Malfunction Threshold

The average of up to 11 periods of the rear A/F sensor (bank 1, sensor 1) inversion cycle is at least 6.8 seconds.

Driving Pattern

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

P0133-0651

Fig. 31: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
 2. Drive the vehicle at a steady speed up to 25 mph (40 km/h), for at least 5 minutes.
 3. Then, drive immediately at a steady speed between 26 - 81 mph (41 - 130 km/h) for at least 6.8 seconds.
- If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0134 (151): ADVANCED DIAGNOSTICS

DTC P0134: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) HEATER SYSTEM MALFUNCTION

P0134-0670

Fig. 32: Rear Air/Fuel Ratio (A/F) Sensor (Bank 1, Sensor 1) Heater System Malfunction

General Description

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is activated by warming the element with the heater and by maintaining it at a steady high temperature to accurately calculate the air/fuel (A/F) ratio. The rear A/F sensor does not become active when the element is not properly heated due to a heater malfunction, and the exhaust emissions deteriorate. The powertrain control module (PCM) monitors the rear A/F sensor internal resistance.

1. When the rear A/F sensor does not activate within a set time after the rear A/F sensor heater starts to warm up (with high rear A/F sensor internal resistance), a malfunction of the rear A/F sensor heater is detected, and a DTC is stored.
2. When the rear A/F sensor heater cycles ON and OFF within a set time, and the resistance remains high when the heater is ON, a malfunction in the rear A/F sensor heater is detected, and a DTC is stored.

Because the effect on engine control differs according to the rear A/F sensor internal resistance, there are two types of malfunction detection threshold levels. When either one is reached, a malfunction is detected.

DTC P0135 (151): ADVANCED DIAGNOSTICS

DTC P0135: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) HEATER CIRCUIT MALFUNCTION

Fig. 33: Rear Air/Fuel Ratio (A/F) Sensor (Bank 1, Sensor 1) Heater - Circuit Diagram

General Description

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold, and it detects oxygen content in the exhaust gas. The rear A/F sensor outputs voltage to the powertrain control module (PCM). The PCM controls fuel injection time by comparing the target air/fuel ratio with the rear A/F sensor signal. The sensor includes the VS cell, the pump cell, the atmospheric reference cavity, the diffusion layer, and the heater, and it enables overall feedback control. The heater is controlled by the PCM and is energized when the sensor element temperature is low. It heats the sensor to stabilize the detection of oxygen content. The PCM monitors the rear A/F sensor heater output (return check). A malfunction is detected if the return signals do not meet the command value (for heater activation) in the PCM for a set time or more and a DTC is stored.

State of the engine	Running	
Other	During rear A/F sensor heater operation	

Malfunction Threshold

One of these conditions must be met for at least 2 seconds.

- No return signal "HIGH" is detected when the PCM output duty is less than 20%.
- Return signal does not change when the PCM output duty is more than 20% and less than 80%.
- No return signal "LOW" is detected when the PCM output duty is more than 80%.

Driving Pattern

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for at least 2 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0137 (161): ADVANCED DIAGNOSTICS

DTC P0137: REAR SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 1, SENSOR 2)) CIRCUIT LOW VOLTAGE

P0137-0703

Fig. 34: Rear Secondary Heated Oxygen Sensor (Secondary HO2S (Bank 1, Sensor 2)) (Low Voltage) - Circuit Diagram

P0137-0570

Fig. 35: Rear Secondary Heated Oxygen Sensor Voltage Graph

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

General Description

The rear secondary heated oxygen sensor (HO2S) (bank 1, sensor 2) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The rear secondary HO2S controls the air/fuel ratio from the rear A/F sensor output voltage so that the TWC efficiency is optimized.

After current is applied to the rear secondary HO2S heater, if the rear secondary HO2S output continues low (lean) during feedback control, a malfunction is detected and a DTC is stored.

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0139 (161): ADVANCED DIAGNOSTICS

DTC P0139: REAR SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 1, SENSOR 2)) CIRCUIT SLOW RESPONSE

P0137-0703

Fig. 38: Rear Secondary Heated Oxygen Sensor (Secondary HO2S (Bank 1, Sensor 2)) (Slow Response) - Circuit Diagram

P0139-0570

Fig. 39: Rear Secondary Heated Oxygen Sensor Voltage Graph

General Description

The rear secondary heated oxygen sensor (HO2S) (bank 1, sensor 2) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The rear secondary HO2S controls the air/fuel ratio with the rear A/F sensor output voltage to optimize TWC efficiency.

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

If the response time of the rear secondary HO2S becomes longer than the specified time after current to the secondary HO2S heater is applied, a malfunction is detected and a DTC is stored.

Malfunction Threshold

1. When the rear secondary HO2S output drops to the response deterioration judgment threshold value and the response characteristics measurement is finished.

ENABLE CONDITIONS CHART

MIN	0.77 seconds
MAX	2.00 seconds

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

2. The voltage does not drop to the response deterioration judgment threshold value after a predetermined time (2.00 seconds) has elapsed.

Driving Pattern

1. Start the engine. Let it idle until the radiator fan comes on.
2. Then, drive immediately at a steady speed of 35 mph (57 km/h) or more for at least 20.7 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0141 (163): ADVANCED DIAGNOSTICS

DTC P0141: REAR SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 1, SENSOR 2)) HEATER CIRCUIT MALFUNCTION

P0137-0703

Fig. 40: Rear Secondary Heated Oxygen Sensor (Secondary HO2S (Bank 1, Sensor 2)) Heater - Circuit Diagram

General Description

A heater for the zirconia element is embedded in the rear secondary heated oxygen sensor (secondary HO2S (bank 1, sensor 2)), and it is controlled by the powertrain control module (PCM). When activated, it heats the sensor to stabilize and speed up the detection of oxygen content when the exhaust gas temperature is cold.

If the rear secondary HO2S heater draws more or less than a specified amperage, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

State of the engine	Running
No active DTCs	P0117, P0118

Malfunction Threshold

The rear secondary HO2S heater output is 0.38 A or less, or 3.33 A or more, for at least 5 seconds when the heater is on.

Driving Pattern

1. Start the engine. Let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 35 mph (57 km/h) or more for at least 5 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0153 (158): ADVANCED DIAGNOSTICS

DTC P0153: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) CIRCUIT SLOW RESPONSE

P0133-0570

Fig. 41: Front Air/Fuel Ratio (A/F) Sensor (Bank 2, Sensor 1) (Slow Response) - Communication Diagram

General Description

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the front A/F sensor output voltage and uses fuel feedback control to improve exhaust emissions. The PCM measures the response characteristics against the front A/F sensor output, and if the accumulated value within the specified time is less than the specified value, it detects a deteriorated response and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Others		Without excessive load change	

Malfunction Threshold

The average of up to 11 periods of the front A/F sensor (bank 2, sensor 1) inversion cycle is at least 6.8 seconds.

Driving Pattern

P0133-0851

Fig. 42: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a steady speed up to 25 mph (40 km/h), for at least 5 minutes.

2008 Acura MDX
2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

3. Then, drive immediately at a steady speed between 26 - 81 mph (41 - 130 km/h) for at least 6.8 seconds.
 - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0154 (152): ADVANCED DIAGNOSTICS

DTC P0154: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) HEATER SYSTEM MALFUNCTION

P0134-0670

Fig. 43: Front Air/Fuel Ratio (A/F) Sensor (Bank 2, Sensor 1) Heater System Malfunction

General Description

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is activated by warming the element with the heater and by maintaining it at a steady high temperature to accurately calculate the air/fuel (A/F) ratio. The front A/F sensor does not become active when the element is not properly heated due to a heater malfunction, and the exhaust emissions deteriorate. The powertrain control module (PCM) monitors the front A/F sensor internal resistance.

1. When the front A/F sensor does not activate within a set time after the front A/F sensor heater starts to warm up (with high front A/F sensor internal resistance), a malfunction of the front A/F sensor heater is detected, and a DTC is stored.
2. When the front A/F sensor heater cycles ON and OFF within a set time, and the resistance remains high when the heater is ON, a malfunction in the front A/F sensor heater is detected, and a DTC is stored.

Because the effect on engine control differs according to the front A/F sensor internal resistance, there are two types of malfunction detection threshold levels. When either one is reached, a malfunction is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	40 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

No active DTCs	P0155, P1174, P2197, P2240, P2241, P2247, P2249, P2254, P2255	

Malfunction Threshold

Malfunction determination 1

The front A/F sensor (bank 2, sensor 1) heater internal resistance value is 110 ohms or more for at least 40 seconds right after the engine starts.

Malfunction determination 2

- The front A/F sensor (bank 2, sensor 1) heater internal resistance value is 110 ohms or more for at least 15 seconds.
- The front A/F sensor (bank 2, sensor 1) heater internal resistance value is 200 ohms or more for at least 1 second.

Driving Pattern

Start the engine, and let it idle for at least 1 minute.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic

runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0155 (152): ADVANCED DIAGNOSTICS

DTC P0155: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) HEATER CIRCUIT MALFUNCTION

Fig. 44: Front Air/Fuel Ratio (A/F) Sensor (Bank 2, Sensor 1) Heater - Circuit Diagram

General Description

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold, and it detects oxygen content in the exhaust gas. The front A/F sensor outputs voltage to the powertrain control module (PCM). The PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. The sensor includes the VS cell, the pump cell, the atmospheric reference cavity, the diffusion layer, and the heater, and it enables overall feedback control. The heater is controlled by the PCM and is energized when the sensor element temperature is low. It heats the sensor to stabilize the detection of oxygen content. The PCM monitors the front A/F sensor heater output (return check). A malfunction is detected if the return signals do not meet the command value (for heater activation) in the PCM for a set time or more and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
-----------	------------

Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
Other	During front A/F sensor heater operation	

Malfunction Threshold

One of these conditions must be met for at least 2 seconds.

- No return signal "HIGH" is detected when the PCM output duty is less than 20%.
- Return signal does not change when the PCM output duty is more than 20% and less than 80%.
- No return signal "LOW" is detected when the PCM output duty is more than 80%.

Driving Pattern

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0157 (162): ADVANCED DIAGNOSTICS

DTC P0157: FRONT SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 2, SENSOR 2)) CIRCUIT LOW VOLTAGE

P0157-0702

Fig. 45: Front Secondary Heated Oxygen Sensor (Secondary HO2S (Bank 2, Sensor 2)) (Low Voltage) - Circuit Diagram

P0137-0570

Fig. 46: Front Secondary Heated Oxygen Sensor Voltage Graph

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

General Description

The front secondary heated oxygen sensor (HO2S) (bank 2, sensor 2) detects the oxygen content in the exhaust gas downstream of the three way catalytic converter (TWC) during stoichiometric air/fuel ratio feedback control. The front secondary HO2S controls the air/fuel ratio from the front A/F sensor output voltage so that the TWC efficiency is optimized.

After current is applied to the front secondary HO2S heater, if the front secondary HO2S sensor output continues low (lean) during feedback control, a malfunction is detected and a DTC is stored.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0171 (153): ADVANCED DIAGNOSTICS

DTC P0171: REAR BANK (BANK 1) FUEL SYSTEM TOO LEAN

Fig. 52: Rear Bank (Bank 1) Fuel System (Too Lean) - Operation Graph

General Description

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions.

Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1.0 (0%), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is higher than normal (too lean), a malfunction in the fuel metering components is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle ⁽¹⁾
Sequence	None
Duration	Every 7 seconds
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A
(1) The malfunction judgment is cleared when it is judged as normal under the same driving conditions in which the malfunction was detected.	

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Engine coolant temperature	156°F (69°C)	-
Intake air temperature	19°F (-7°C)	-
Engine speed	550 rpm	4,000 rpm
MAP value	20 kPa (6.0 in.Hg, 150 mmHg)	-
Fuel feedback	Closed loop	
Monitoring priority	P0420, P0430, P0456, P0457	
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0137, P0138, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0401, P0404, P0443, P0496, P0497, P0627, P1128, P1129, P1172, P145C, P2195, P2227, P2228, P2229, P2237, P2238, P2243, P2245, P2251, P2252, P2270, P2271, P2413, P2646, P2646, P2647, P2647, P2648, P2649	

Malfunction Threshold

Long term fuel trim is higher than 1.188 (+18.8%).

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
 2. Then, drive at a steady speed between 15 - 75 mph (24 - 120 km/h) for at least 15 minutes, and watch the long term fuel trim. If the long term fuel trim stays at about 1.0, the vehicle is OK or it is a very minor problem. If a significant fault is still present, the long term fuel trim will move up or down while driving.
- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Pattern 2.
 - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
 - After clearing the DTC by disconnecting the battery or using the scan tool, extend Driving Pattern 2 to 40 minutes or longer to allow time for long term fuel trim to recover.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0172 (153): ADVANCED DIAGNOSTICS

DTC P0172: REAR BANK (BANK 1) FUEL SYSTEM TOO RICH

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Fig. 53: Rear Bank (Bank 1) Fuel System (Too Rich) - Operation Graph

General Description

The powertrain control module (PCM) detects the oxygen content in the exhaust gas from the rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) signal voltage, and it uses fuel feedback control to maintain the optimal air/fuel ratio. The air/fuel ratio coefficient for correcting the amount of injected fuel is the short term fuel trim. The PCM varies short term fuel trim continuously to keep the air/fuel ratio close to the stoichiometric ratio for all driving conditions. Long term fuel trim is computed from short term fuel trim and is used to regulate long term deviation from the stoichiometric air/fuel ratio, which occurs when fuel metering components deteriorate with age or system failures occur. In addition, long term fuel trim is stored in the PCM memory and is used to determine when fuel metering components malfunction. When long term fuel trim is higher than normal, which is about 1.0 (0%), the amount of injected fuel must be increased, and when lower than normal, it must be decreased. If long term fuel trim is lower than normal (too rich), a malfunction in the fuel metering components is detected and a DTC is stored.

Diagnosis Details**Conditions for illuminating the MIL**

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0222 (7): ADVANCED DIAGNOSTICS**DTC P0222: THROTTLE POSITION (TP) SENSOR B CIRCUIT LOW VOLTAGE**

P0122-0503

Fig. 56: Throttle Position (TP) Sensor B (Low Voltage) - Circuit Diagram

General Description

Throttle position (TP) sensor B is a semiconductor type, and it is attached to the throttle body and shaft to determine throttle valve position. The throttle valve position signal from TP sensor B is transmitted to the powertrain control module (PCM) for target position feedback control. If the signal from TP sensor B is less than a fixed value for a set time, the PCM detects a TP sensor B malfunction and stores a DTC.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0300 (77): ADVANCED DIAGNOSTICS

DTC P0300: RANDOM MISFIRE DETECTED

Fig. 58: Crankshaft Position Sensor Pulse Data Chart

General Description

The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The powertrain control module (PCM) monitors the crankshaft rotation speed based on the output pulses from the crankshaft position (CKP) sensor. By monitoring changes in the crankshaft rotation speed, the PCM counts the number of misfires and determines which cylinder is misfiring. If more than one DTC from P0301 through P0306 has been stored while misfires in multiple cylinders are detected, a malfunction is detected and a DTC is stored.

There are two types of misfire detection.

Type 1 (1 drive cycle): When the number of misfires per 200 engine revolutions reaches the level that damages the three way catalyst (TWC), a DTC is stored and the MIL blinks. When the misfire ceases, the MIL remains on steady instead of blinking.

Type 2 (2 drive cycles): When the number of misfires per 1,000 engine revolutions reaches the level that affects FTP mode exhaust emissions, a DTC is stored and the MIL comes on.

Other		Test-drive on a flat road to avoid misdetection	
(1) When starting the engine at an engine coolant temperature of more than 14°F (-10°C).			
(2) When starting the engine at an engine coolant temperature of 14°F (-10°C) or less.			
(3) Varies with driving conditions.			

Malfunction Threshold

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

MALFUNCTION THRESHOLD CHART

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	27 - 90 times ⁽¹⁾
Misfire Type 2 (Light)	Per 1,000 revolutions	55 times
(1) Depending on engine speed and load.		

Driving Pattern

P0301-0350

Fig. 59: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
 2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 3 minutes.
 3. Stop the vehicle, and let the engine idle for at least 3 minutes.
- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
 - When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

Misfire Type 1: Under high rpm or high load conditions: The MIL blinks once per second if a type 1 misfire (catalyst damaging) occurs, and a Temporary DTC is stored. If the type 1 misfire ceases, the MIL goes off. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks at the first misfire occurrence, and the DTC and the freeze frame data are stored. The MIL remains on steady if the type 1 misfire ceases.

Under normal driving conditions: The MIL blinks once per second if a type 1 misfire occurs a third time, and a Temporary DTC is stored. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks during the third type 1 misfire occurrence, and the DTC and the freeze frame data are stored. If the type 1 misfire ceases, the MIL remains on steady.

Misfire Type 2: When a type 2 misfire (emission-related but not severe enough to immediately damage the TWC) occurs within the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored.

If a type 2 misfire occurs after the first 1,000 engine revolutions after engine start-up, a Temporary DTC is

stored during the fourth type 2 misfire occurrence.

If a type 2 misfire occurs during the next (second) drive cycle, the MIL comes on, and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0301 (71), P0302 (72), P0303 (73), P0304 (74), P0305 (75), P0306 (76): ADVANCED DIAGNOSTICS

DTC P0301: NO. 1 CYLINDER MISFIRE DETECTED; DTC P0302: NO. 2 CYLINDER MISFIRE DETECTED; DTC P0303: NO. 3 CYLINDER MISFIRE DETECTED; DTC P0304: NO. 4 CYLINDER MISFIRE DETECTED; DTC P0305: NO. 5 CYLINDER MISFIRE DETECTED; DTC P0306: NO. 6 CYLINDER MISFIRE DETECTED

Fig. 60: Crankshaft Position Sensor Pulse Data Chart

General Description

The crankshaft vibrates slightly when each cylinder fires. If a misfire occurs, the crankshaft rotation speed changes rapidly. The powertrain control module (PCM) monitors engine misfiring based on the output pulses from the crankshaft position (CKP) sensor, counts the number of misfires, and determines which cylinder is misfiring. If a misfire is detected, a DTC is stored.

There are two types of misfire detection.

Type 1 (1 drive cycle): When the number of misfires per 200 engine revolutions reaches the level that damages the three way catalyst (TWC), a DTC is stored and the MIL blinks. When the misfire ceases, the MIL remains on steady instead of blinking.

Type 2 (2 drive cycles): When the number of misfires per 1,000 engine revolutions reaches the level that affects FTP mode exhaust emissions, a DTC is stored and the MIL comes on.

(1) When starting the engine at an engine coolant temperature of more than 14°F (-10°C).			
(2) When starting the engine at an engine coolant temperature of 14°F (-10°C) or less.			
(3) Varies with driving conditions.			

Malfunction Threshold

The number of misfires versus engine revolutions is equal to or greater than the values in the table.

MALFUNCTION THRESHOLD CHART

--	--	--

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Misfire Type	The number of engine revolutions	The number of misfires
Misfire Type 1 (Severe)	Per 200 revolutions	27 - 90 times ⁽¹⁾
Misfire Type 2 (Light)	Per 1,000 revolutions	55 times
(1) Depending on engine speed and load.		

Driving Pattern

P0301-0350

Fig. 61: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
 2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 3 minutes.
 3. Stop the vehicle, and let the engine idle for at least 3 minutes.
- When freeze frame data is stored, drive the vehicle under those conditions instead of Driving Patterns 2 or 3.
 - When you have difficulty duplicating the DTC because of road conditions and traffic situations, repeat the driving pattern several times.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

Misfire Type 1: Under high rpm or high load conditions: The MIL blinks once per second if a type 1 misfire (catalyst damaging) occurs, and a Temporary DTC is stored. If the type 1 misfire ceases, the MIL goes off. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks at the first misfire occurrence, and the DTC and the freeze frame data are stored. The MIL remains on steady if the type 1 misfire ceases.

Under normal driving conditions: The MIL blinks once per second if a type 1 misfire occurs a third time, and a Temporary DTC is stored. If a type 1 misfire occurs during the next (second) drive cycle, the MIL blinks during the third type 1 misfire occurrence, and the DTC and the freeze frame data are stored. If the type 1 misfire ceases, the MIL remains on steady.

Misfire Type 2: When a type 2 misfire (emission-related but not severe enough to immediately damage the TWC) occurs within the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored.

If a type 2 misfire occurs after the first 1,000 engine revolutions after engine start-up, a Temporary DTC is stored during the fourth type 2 misfire occurrence.

If a type 2 misfire occurs during the next (second) drive cycle, the MIL comes on, and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0325 (23): ADVANCED DIAGNOSTICS

DTC P0325: KNOCK SENSOR CIRCUIT MALFUNCTION

Fig. 62: Knock Sensor - Circuit Diagram

General Description

The knock sensor is mounted on the engine block and detects engine knocking. The vibrations caused by the knocking are converted into electrical signals through the piezo ceramic element. The powertrain control module (PCM) controls the ignition timing based on the electrical signals. If the signals from the knock sensor do not vary for a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Engine speed	2,000 rpm	-
Engine coolant temperature	140°F (60°C)	-
No active DTCs	P0117, P0118	

Malfunction Threshold

No signals from the knock sensor are detected for at least 5 seconds.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Hold the engine speed at 3,000 - 4,000 rpm for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0335 (4) (PGM-FI SYSTEM): ADVANCED DIAGNOSTICS

DTC P0335: CRANKSHAFT POSITION (CKP) SENSOR A NO SIGNAL (PGM-FI SYSTEM)

P0335-0702

Fig. 63: Crankshaft Position (CKP) Sensor A (No Signal) - Circuit Diagram

General Description (PGM-FI System)

Crankshaft position (CKP) sensor A consists of a rotor and a semiconductor that detects rotor position. When the engine starts, the rotor turns and the magnetic flux in the semiconductor changes. The changes of magnetic flux are converted into pulsing signals to the powertrain control module (PCM). CKP sensor A detects injection/ignition timing for each cylinder and engine speed.

If no pulsing signals are detected from CKP sensor A, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (PGM-FI System)

DTC P0401 (80): ADVANCED DIAGNOSTICS

DTC P0401: EXHAUST GAS RECIRCULATION (EGR) INSUFFICIENT FLOW

P0401-0772

Fig. 75: Exhaust Gas Recirculation (EGR) - System Diagram

P0401-0371

Fig. 76: Exhaust Gas Recirculation Operation Graph

General Description

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows from the exhaust manifold through the EGR valve and the intake manifold and the EGR passage. the exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions.

The EGR flow is inspected as follows. The EGR valve is closed during deceleration with the throttle valve fully closed. Then the PCM fully opens the EGR valve. After a set time, the PCM computes the ratio of the present EGR flow to the normal EGR flow by monitoring the fluctuation of the intake manifold pressure between when the EGR valve is fully opened and when it is fully closed. If the EGR flow rate is lower than normal, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Malfunction Threshold

The ratio of the current EGR flow to the normal EGR flow is 15% or less.

The difference between the MAP value before and after the Enable Conditions are met is no more than the

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

values in the table. The change in pressure should occur for at least 3 seconds.

MALFUNCTION THRESHOLD CHART

Engine speed	Barometric pressure	
	52 kPa (15.4 in.Hg, 392 mmHg)	102 kPa (30.0 in.Hg, 760 mmHg)
1,100 rpm	7 kPa (2.2 in.Hg, 56 mmHg)	12 kPa (3.6 in.Hg, 93 mmHg)
2,000 rpm	3 kPa (1.1 in.Hg, 29 mmHg)	7 kPa (2.2 in.Hg, 57 mmHg)

Confirmation Procedure with the HDS

Do the EGR TEST in the INSPECTION MENU with the HDS.

Driving Pattern

P0401-0350

Fig. 77: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
 2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
 3. Then, drive at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
 4. Decelerate with the throttle valve fully closed for at least 4 seconds.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0404 (12): ADVANCED DIAGNOSTICS

DTC P0404: EXHAUST GAS RECIRCULATION (EGR) CONTROL CIRCUIT RANGE/PERFORMANCE PROBLEM

P0404-0370

Fig. 78: Exhaust Gas Recirculation (EGR) Control Performance Graph

General Description

The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows from the exhaust manifold through the EGR valve and the intake manifold and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower combustion temperatures, thus reducing oxides of nitrogen (NO_x) emissions.

A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the PCM so that exhaust gas recirculation can be optimized according to driving conditions.

Comparing this command value with the lift sensor output signal value, the PCM controls the EGR valve to make the amount of actual valve lift equal to the command value.

If the lift sensor output (actual valve lift) is greater than the commanded valve lift, an abnormality in the EGR valve or the lift sensor output is determined.

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Engine speed	-	4,400 rpm
Battery voltage	10.5 V	-
Commanded EGR valve lift	0.012 in. (0.3 mm)	-
No active DTCs	P0101, P0101, P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0401, P0406, P1128, P1129, P1172, P1174, P2195, P2197, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255	

Malfunction Threshold

The difference between the command value of the amount of EGR valve lift in the PCM and the actual amount of valve lift is 0.041 in. (1.020 mm) or more for at least 5 seconds.

Confirmation Procedure with the HDS

Do the EGR TEST in the INSPECTION MENU with the HDS.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 15 - 75 mph (24 - 120 km/h) for at least 5 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0406 (12): ADVANCED DIAGNOSTICS**DTC P0406: EXHAUST GAS RECIRCULATION (EGR) VALVE POSITION SENSOR CIRCUIT HIGH VOLTAGE**

P0401-0301

Fig. 79: Exhaust Gas Recirculation (EGR) Valve Position Sensor (High Voltage) - Circuit Diagram

General Description

The exhaust gas recirculation (EGR) system reduces oxides of nitrogen (NOx). NOx is generated by high combustion temperatures. The EGR system lowers peak combustion temperature by recirculating exhaust gas into the air/fuel mixture, thus reducing NOx emissions. To determine the optional amount of recirculating exhaust gas depending on driving conditions, a command value (the amount of valve lift) is stored in the powertrain control module (PCM). The EGR valve position sensor indicates the amount of valve lift, and the PCM controls the EGR valve so that the amount of actual valve lift equals the command value.

If the EGR valve position sensor output signal voltage is not within a specified value, a malfunction is detected and a DTC is stored.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0420 (165): ADVANCED DIAGNOSTICS

DTC P0420: REAR BANK CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1)

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Fig. 80: Rear Bank Catalyst System Efficiency Graph

General Description

The three way catalytic converter (TWC) converts hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NO_x) in the exhaust gas to water vapor, carbon dioxide (CO₂), and dinitrogen (N₂).

The TWC efficiency does not depend entirely on engine conditions or the deterioration level of the TWC. It can be optimized by stabilizing the secondary HO₂S output.

If the TWC deteriorates, the air/fuel ratio downstream of the TWC (the secondary HO₂S output) often differs from the target secondary HO₂S output, and the status is represented by the parameter (SIGSQRLS).

Therefore, if the SIGSQRLS exceeds a specified value for a set time, a malfunction is detected and a DTC is stored.

DTC P0443 (92): ADVANCED DIAGNOSTICS

DTC P0443: EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE CIRCUIT MALFUNCTION

P0443-0301

Fig. 84: Evaporative Emission (EVAP) Canister Purge Valve - Circuit Diagram

General Description

The evaporative emission (EVAP) canister purge valve is attached to the vacuum port between the EVAP canister and the intake manifold. The powertrain control module (PCM) does not turn on the EVAP canister purge valve when the engine coolant temperature is 140°F (60°C) or less. The PCM adjusts the amount of fuel vapor sent to the engine by controlling the EVAP canister purge valve duty cycle.

When the return signal does not change according to the EVAP canister purge valve duty cycle for a set time, the PCM detects a malfunction, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Diagnosis Details**Conditions for illuminating the MIL**

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0451 (91): ADVANCED DIAGNOSTICS**DTC P0451: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM**

P0452-0302

Fig. 85: Fuel Tank Pressure (FTP) Sensor - Circuit Diagram

P0451-0670

Fig. 86: Fuel Tank Pressure (FTP) Sensor Voltage Graph

P0451-0071

Fig. 87: Fuel Tank Pressure (FTP) Sensor Operation Graph**General Description**

The fuel tank pressure (FTP) sensor is installed on the evaporative emission (EVAP) canister. The FTP sensor is used to detect leaks in the EVAP system. The powertrain control module (PCM) monitors the FTP sensor output voltage. The FTP sensor output voltage rises as the fuel tank pressure increases. Conversely, the FTP sensor output voltage drops as the fuel tank pressure decreases. Rapid changes in the FTP sensor output voltage due to electrical noise or an intermittent open during the EVAP leak detection may cause incorrect leak detection, so abnormal output is monitored.

If the FTP sensor output voltage changes a specified number of times within a set time, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

DTC P0455 (90): ADVANCED DIAGNOSTICS

DTC P0455: EVAPORATIVE EMISSION (EVAP) SYSTEM VERY LARGE LEAK DETECTED

P0442-0570

Fig. 94: Evaporative Emission (EVAP) System Diagram

Diagnosis Execution

P0455-0770

Fig. 95: Evaporative Emission (EVAP) System Diagnosis Execution

General Description

The evaporative emission (EVAP) leak detection system uses an engine off natural vacuum (EONV) method. The EONV method detects leakage from the change in fuel tank pressure via the fuel tank pressure (FTP) sensor with the engine off.

Here is an overview of the malfunction detection for the EONV method:

Step 1: Judgement of detection of 0.09 inch leak as normal operation

Step 2: Judgement of detection of 0.02 inch leak as normal operation

Step 3: Detection of 0.02 inch leak

Step 4: Detection of atmospheric pressure failure

Step 5: Flickering of the FTP sensor

< Step 1, 2 and 3 proceed simultaneously. Step 4 and 5 proceed simultaneously. >

Step 1:

After the engine has stopped, the powertrain control module (PCM) monitors the variation of the FTP sensor output to detect "no 0.09 inch leak" depending on the variation of the pressure inside the fuel tank.

- If the variation of the pressure is less than a specified value and continues for a specified duration, it is identified as a "0.09 inch leak" and the diagnosis completes.
- If the variation of the pressure is more than a specified value before a specified duration has passed, it is

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

defined as "no 0.09 inch leak", the judgement of detection of a 0.09 inch leak is completed, and it goes to 0.02 inch leak monitor.

Step 2:

After the engine has stopped, the PCM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure inside the fuel tank does not increase a specified value or more within a specified duration, it goes to step 3.

Step 3:

The PCM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank. until the detection completes.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure is not atmospheric pressure or less when the detection is completed, that data is stored and the diagnosis is complete.

Step 4:

After the engine has stopped, the PCM monitors the variation of the FTP sensor output to detect atmospheric pressure, after keeping the canister vent opened for a specified duration to stabilize the pressure inside the fuel tank.

- If the pressure inside the fuel tank after a specified duration has not reached a specified value from the sensor zero point, a canister vent blockage is detected.

Step 5:

After the engine has stopped, the PCM monitors the variation of the FTP sensor output to detect FTP sensor electrical noise failure, after keeping the canister vent opened for a specified time to stabilize the pressure inside the fuel tank.

- If the deviation of pressure inside the fuel tank and an average value after a specified duration has exceeded a specified value for more than a specified duration, an FTP sensor electrical noise failure is detected.

(2) The initial engine coolant temperature minus the initial intake air temperature		

Malfunction Threshold

The variation of pressure inside the fuel tank is 0.03 kPa (0.009 in.Hg, 0.24 mmHg) or more.

Confirmation Procedure with the HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
2. Warm up the engine at idle until the radiator fan comes on.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 20 minutes.
4. After stopping the engine, turn the ignition switch off, and leave the vehicle for 37 minutes or more

(EONV executes).

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

Step 5: Flickering of the FTP sensor

< Step 1, 2 and 3 proceed simultaneously. Step 4 and 5 proceed simultaneously. >

Step 1:

After the engine has stopped, the powertrain control module (PCM) monitors the variation of the FTP sensor output to detect "no 0.09 inch leak" depending on the variation of the pressure inside the fuel tank.

- If the variation of the pressure is less than a specified value and continues for a specified duration, it is identified as a "0.09 inch leak" and the diagnosis completes.
- If the variation of the pressure is more than a specified value before a specified duration has passed, it is

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

defined as "no 0.09 inch leak", the judgement of detection of a 0.09 inch leak is completed, and it goes to 0.02 inch leak monitor.

Step 2:

After the engine has stopped, the PCM monitors the variation of the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the increasing pressure inside the fuel tank.

- If "no 0.02 inch leak" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure inside the fuel tank does not increase a specified value or more within a specified duration, it goes to step 3.

Step 3:

The PCM continues to monitor the FTP sensor output to detect "no 0.02 inch leak" depending on the variation corresponding to the decreasing pressure inside the fuel tank. until the detection completes.

- If a "0.02 inch leak" is detected, it is identified as a malfunction; the diagnosis is complete.
- If "no leakage" is detected, it is identified as normal; the diagnosis is complete.
- If the pressure is not atmospheric pressure or less when the detection is completed, that data is stored and the diagnosis is complete.

Step 4:

After the engine has stopped, the PCM monitors the variation of the FTP sensor output to detect atmospheric pressure, after keeping the canister vent opened for a specified duration to stabilize the pressure inside the fuel tank.

- If the pressure inside the fuel tank after a specified duration has not reached a specified value from the sensor zero point, a canister vent blockage is detected.

Step 5:

After the engine has stopped, the PCM monitors the variation of the FTP sensor output to detect FTP sensor electrical noise failure, after keeping the canister vent opened for a specified time to stabilize the pressure inside the fuel tank.

- If the deviation of pressure inside the fuel tank and an average value after a specified duration has exceeded a specified value for more than a specified duration, an FTP sensor electrical noise failure is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	P0455, P0457, P0497 are judged as OK

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Duration	At least 16 minutes, 37 seconds but not more than 36 minutes, 37 seconds
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Elapsed time before starting the engine	6 hours	-
Initial condition A ⁽¹⁾	-	18°F (10°C)
Initial condition B ⁽²⁾	-	18°F (10°C)
Initial engine coolant temperature	40°F (5°C)	95°F (35°C)
Initial intake air temperature	40°F (5°C)	95°F (35°C)
Barometric pressure	76 kPa (22.5 in.Hg, 569 mmHg)	-
Battery voltage	10.5 V	-
No active DTCs	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P0685, P1116, P1454, P145C, P2227, P2228, P2229, P2422, P2610	
Others	Other than when there is excessive vapor generation (fuel level is not full)	
	Avoid abrupt acceleration, deceleration, and turns	
	Test-drive on a flat road to avoid misdetection	
	No refueling is required	
(1) The initial intake air temperature minus the current intake air temperature		
(2) The initial engine coolant temperature minus the initial intake air temperature		

Malfunction Threshold

- The misalignment of zero point pressure inside the fuel tank is 0.6 kPa (0.1 in.Hg, 5 mmHg) or more.
- The output from the FTP sensor flickering is 3.04 seconds or more.
- The variation of pressure inside the fuel tank after phase 1 is 0.3 kPa (0.1 in.Hg, 2.8 mmHg) or more (depending on fuel level and barometric pressure).
- The sum of the variations of pressure inside the fuel tank after phase 1 and phase 2 is 10 kPa (3.1 in.Hg, 80 mmHg) or less (depending on fuel level and barometric pressure).
- The barometric pressure is stable for at least 24 minutes, 55 seconds.

Confirmation Procedure with the HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

1. After the vehicle has been left for an appropriate amount of time as specified, with the engine coolant temperature and intake air temperature within the specified range, start the engine.
 2. Warm up the engine at idle until the radiator fan comes on.
 3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 20 minutes.
 4. After stopping the engine, turn the ignition switch off, and leave the vehicle for 37 minutes or more (EONV executes).
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle with the ECT and IAT at engine start-up within the specified temperature range, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle with the ECT and IAT at engine start-up within the specified temperature range, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0457 (90): ADVANCED DIAGNOSTICS

DTC P0457: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTED/FUEL FILL CAP LOOSE OR MISSING

P0457-0770

Fig. 98: Evaporative Emission (EVAP) System Diagram

P0457-0771

Fig. 99: Evaporative Emission (EVAP) System Pressure Graph

General Description

When the fuel fill cap is installed properly, the purge flow occurs due to the airflow resistance of the canister, and tank pressure will be reduced.

When the fuel fill cap is loosened, the fuel tank pressure will not decrease even when the airflow resistance decreases and the purge flow occurs, because air is being exhausted from the tank to the atmosphere.

By examining the fuel tank pressure with less purge flow area and the fuel tank pressure with more purge flow area, and using the above characteristics, a loose fuel fill cap is detected.

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

The powertrain control module (PCM) calculates the relationship of the purge flow and fuel tank pressure (FTP) sensor, and when the slope of the decreasing fuel tank pressure to the purge flow increase is small, a loose fuel fill cap is detected.

< Above failure detection is normally operated during purge >

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Malfunction Threshold

The output from the fuel cap monitor is 0.053 or more for at least 12 seconds (when there is no NG judgment history in this drive cycle).

Confirmation Procedure with the HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 12 seconds.
3. Drive the vehicle immediately at a speed between 45 - 75 mph (72 - 120 km/h) for at least 12 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the fuel fill cap caution

1. When a loose fuel fill cap is judged by this detection, the fuel fill cap caution is displayed. At this time, a DTC is not stored.
2. When the first drive cycle leak judgement (temporary DTC stored) is detected at a 0.02 inch leak or a 0.09 inch leak, the fuel fill cap caution is displayed when the ignition is turned on the next time.

Conditions for clearing the fuel fill cap caution

1. When the fuel fill cap caution is displayed by the first drive cycle leak judgement (temporary DTC stored) at a 0.02 inch leak or a 0.09 inch leak, the fuel fill cap caution goes out when the next failure occurs (second drive cycle) and P0457 is stored. (MIL illuminates)
2. When no leak is judged by a 0.02 inch leak or a 0.09 inch leak after the fuel fill cap caution is displayed, the fuel fill cap caution goes out when the ignition is turned on the next time. (P0457 is not stored at this time)
3. When driven three times without this failure detected and a 0.02 inch leak or a 0.09 inch leak detection is not done after the fuel fill cap caution is displayed, the fuel fill cap caution goes out. (P0457 is not stored at this time)
4. Use the Clear command of scan tool to erase the caution. The caution is erased when the MIL is illuminated.

DTC P0461 (121): ADVANCED DIAGNOSTICS

DTC P0461: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT RANGE/PERFORMANCE PROBLEM

Normal**Malfunction**

P0461-0370

Fig. 100: Fuel Level Sensor (Fuel Gauge Sending Unit) Performance Graph**General Description**

The fuel level sensor is incorporated with the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float into electrical signals that correspond to the fuel level, and it indicates the amount of fuel in the fuel tank. If the powertrain control module (PCM) receives no change in the fuel level sensor output after driving for a specified number of miles, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Once per driving cycle
Sequence	None

Duration	-
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Mileage	125 miles (200 km)	-
No active DTCs	P0462, P0463, U0028, U0155	
Others	Avoid driving and stopping on a steep road	

Malfunction Threshold

The change in the fuel level sensor output is 3.5% or less.

Driving Pattern

Drive for the specified mileage under Enable Conditions without refueling. (turning the ignition switch off is acceptable.)

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0462 (121): ADVANCED DIAGNOSTICS

DTC P0462: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT LOW VOLTAGE

P0462-0504

Fig. 101: Fuel Level Sensor (Fuel Gauge Sending Unit) (Low Voltage) - Circuit Diagram

General Description

The fuel level sensor (fuel gauge sending unit) is incorporated with the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float into electrical signals as an output that corresponds to fuel level variations in the fuel tank. The fuel level, which is indicated by the gauge control module, is sent to the powertrain control module (PCM) via the controller area network (CAN). If the PCM detects a signal from the fuel level sensor (fuel gauge sending unit) below a predetermined value for a set time or more, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Malfunction Threshold

The fuel level sensor (fuel gauge sending unit) output voltage is 0.10 V or less for at least 5 seconds.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0463 (121): ADVANCED DIAGNOSTICS

DTC P0463: FUEL LEVEL SENSOR (FUEL GAUGE SENDING UNIT) CIRCUIT HIGH VOLTAGE

P0462-0504

Fig. 102: Fuel Level Sensor (Fuel Gauge Sending Unit) (High Voltage) - Circuit Diagram

General Description

The fuel level sensor (fuel gauge sending unit) is incorporated into the fuel pump and installed in the fuel tank. Using a built-in potentiometer and float, it converts the movement of the float to electrical signals that correspond to fuel level variations, and it measures the remaining fuel in the fuel tank. The fuel level, which is read by the gauge control module, is sent to the powertrain control module (PCM) via the controller area network (CAN). If the PCM detects a signal voltage from the fuel level sensor (fuel gauge sending unit) above a predetermined value for a set time or more, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more

OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch	ON	
No active DTCs	P0462, U0028, U0155	

Malfunction Threshold

The fuel level sensor (fuel gauge sending unit) output voltage is 4.92 V or more for at least 5 seconds.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0496 (92): ADVANCED DIAGNOSTICS

DTC P0496: EVAPORATIVE EMISSION (EVAP) SYSTEM HIGH PURGE FLOW

P0496-0770

Fig. 103: Evaporative Emission (EVAP) System High Purge Flow Diagram

General Description

The fuel (vapor) vaporized in the fuel tank is stored in the canister temporarily and introduced in the engine through the evaporative emission (EVAP) canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by repeatedly switching power to the EVAP canister purge valve at a constant frequency according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve drive cycle is transmitted to the fuel tank pressure (FTP) sensor by the purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failure part according to < STEP 2 >.

< STEP 2 >

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition is turned off:
P0496 EVAP canister purge valve stuck OPEN

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

When there is no fluctuation of the FTP sensor: P0497 purge flow NG

DTC P0498 (117): ADVANCED DIAGNOSTICS

DTC P0498: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CONTROL CIRCUIT LOW VOLTAGE

P0498-0705

Fig. 105: Evaporative Emission (EVAP) Canister Vent Shut Valve Control (Low Voltage) - Circuit Diagram

General Description

The evaporative emission (EVAP) canister vent shut valve is attached to the EVAP canister to control the venting of the EVAP canister to atmosphere.

The EVAP canister vent shut valve is open (open to atmosphere) when the VSV signal is OFF.

If the return signal is "OFF" when the powertrain control module (PCM) outputs the "ON" signal to the EVAP canister vent shut valve, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0506 (14): ADVANCED DIAGNOSTICS**DTC P0506: IDLE CONTROL SYSTEM RPM LOWER THAN EXPECTED**

P0506-0774

Fig. 107: Idle Control System - Communication Diagram

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Fig. 108: Idle Control System Operation Graph

General Description

A target idle speed that meets the engine operating conditions (coolant temperature, A/C ON or OFF, etc.) is stored in the powertrain control module (PCM). The PCM monitors and controls the idle speed so that the actual idle speed is equal to the target idle speed. If the actual idle speed varies beyond a specified value from the target speed over a certain period of time, the PCM detects a malfunction in the idle speed control system and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Fuel feedback	Closed loop	
Throttle position	Fully closed	
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0401, P0404, P0443, P0496, P0497, P1128, P1129, P145C, P2101, P2118, P2122, P2123, P2127, P2128, P2135, P2138, P2176, P2413, P2646, P2647, P2648, P2649	
Other	The engine is under no load	

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Malfunction Threshold

The actual idle speed is at least 100 rpm less than the target idle speed for at least 20 seconds.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 20 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0507 (14): ADVANCED DIAGNOSTICS

DTC P0507: IDLE CONTROL SYSTEM RPM HIGHER THAN EXPECTED

P0506-0774

Fig. 109: Idle Control System (RPM Higher) - Communication Diagram

P0507-0370

Fig. 110: Idle Control System Operation Graph

General Description

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

A target idle speed that meets the engine operating conditions (coolant temperature, A/C ON or OFF, etc.) is stored in the powertrain control module (PCM). The PCM monitors and controls the idle speed so that the actual idle speed is equal to the target idle speed. If the actual idle speed varies beyond a specified value from the target speed over a certain period of time, the PCM detects a malfunction in the idle speed control system and a DTC is stored.

the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0562 (34): ADVANCED DIAGNOSTICS

DTC P0562: CHARGING SYSTEM LOW VOLTAGE

Fig. 115: Charging System (Low Voltage) - Circuit Diagram

General Description

The alternator is driven by the engine, and it generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the powertrain control module (PCM)). The alternator output signal is sent to the PCM, and it varies according to the battery's state of charge, the electrical load, and engine speed.

When the IGP (power source) terminal voltage is a set value or less for a set time, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Engine speed	500 rpm	-

Malfunction Threshold

The IGP terminal voltage is 11.0 V or less for at least 60 seconds.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0563 (34): ADVANCED DIAGNOSTICS

DTC P0563: POWERTRAIN CONTROL MODULE (PCM) POWER SOURCE CIRCUIT UNEXPECTED VOLTAGE

P0563-0700

Fig. 116: Powertrain Control Module (PCM) Power Source (Unexpected Voltage) - Circuit Diagram

General Description

If there is a short to ground in the harness between the powertrain control module (PCM) and PGM-FI main relay 1 (FI MAIN), PGM-FI main relay 1 (FI MAIN) stays ON even though the ignition switch is OFF, and the PCM remains active. However, the engine is not running because the power for the gauges, the ignition, and the fuel pump is turned OFF by the ignition switch.

When the PCM operates for a set time after the ignition switch is turned OFF, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage (IGP terminal of PCM)	10.1 V	-

Malfunction Threshold

The PCM operates for at least 5 seconds after the ignition switch is turned OFF.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0602 (196): ADVANCED DIAGNOSTICS

DTC P0602: POWERTRAIN CONTROL MODULE (PCM) PROGRAMMING ERROR

Fig. 117: Powertrain Control Module (PCM) Program Diagram

General Description

The powertrain control module (PCM) is equipped with an update program to update its control program. The programs in the CPU of the PCM are classified as a PCM program (update-capable program) and a program for the update function (non-updateable program). The program update only updates the PCM program.

When the PCM power is turned off during an update, the power for the update function is lost, and the update process stops. When the program update is stopped before it is completed, the PCM stores a DTC that indicates the update is not finished.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	
Ignition switch	ON

Malfunction Threshold

The PCM program update is stopped before it is finished for at most 1 second.

Diagnosis Details

Conditions for illuminating the MIL

When the PCM program is not written in the PCM, the MIL comes on and the DTC is stored in the PCM memory.

Conditions for clearing the MIL

The MIL and the DTC will be cleared when the PCM program update is complete.

DTC P060A (131): ADVANCED DIAGNOSTICS

DTC P060A: POWERTRAIN CONTROL MODULE (PCM) INTERNAL CONTROL MODULE MALFUNCTION

Fig. 118: Powertrain Control Module (PCM) Internal Control Module - Communication Diagram

General Description

When a malfunction occurs in the serial communication between the FI CPU and the A/T CPU in the powertrain control module (PCM) and the serial communication is interrupted for a set time or more, or when the watchdog timer that monitors the A/T CPU detects an abnormality in the A/T CPU and notifies the FI CPU via the A/T CPU check signal line, the PCM detects a malfunction and a DTC is stored.

2008 Acura MDX

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration 0.2	second or more ⁽¹⁾ , 1.1 seconds or more ⁽²⁾
DTC Type	One drive cycle, MIL ON
OBD Status	N/A
(1) Symptom 1	
(2) Symptom 2	

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch	ON	

Malfunction Threshold

One of these symptom occurs.

- Symptom 1

The serial communication between the FI CPU and A/T CPU is abnormal or the serial communication is interrupted for at least 0.2 second.

- Symptom 2

The watchdog timer that monitors the A/T CPU detects an abnormality, and the FI CPU receives the A/T CPU check signal for at least 1.1 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by

disconnecting the battery.

DTC P0615 (198): ADVANCED DIAGNOSTICS

DTC P0615: STARTER CUT RELAY STRLD CIRCUIT MALFUNCTION

P0615-0701

Fig. 119: Starter Cut Relay STRLD - Circuit Diagram

General Description

A starter switch inhibit system prevents the starter from working during engine rotation to prevent damage to the starter pinion gear.

If the ignition switch is switched to START (III) position mistakenly while the engine is running, the powertrain control module (PCM) prevents the starter from working according to the engine rotation information and the output (STRLY) signal of the starter cut relay is switched to LOW.

In this system, two starter cut relays are connected in series (starter cut relay 1, starter cut relay 2) to prevent the starter cut relay to continue rotation by the ON malfunction of the starter.

Also a diagnosis line (STRLD) is used to monitor voltage in the middle of starter cut relay 1 and starter cut relay 2. The PCM detects an OPEN malfunction an ON malfunction of starter cut relay 1, and an ON malfunction of starter cut relay 2, according to the information.

If the voltage of the diagnosis line (STRLD) input does not exceed upper and lower limit for a specified

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

duration when the ignition switch is at the START (III) position and the output of the starter cut relay (STRLY) is HIGH (starter ON), an OPEN malfunction of the diagnosis line is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

The diagnosis line (STRLD) input voltage is between 2.4 V to 2.6 V for at least 0.8 second.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0627 (169): ADVANCED DIAGNOSTICS

DTC P0627: FUEL PUMP CONTROL MODULE SYSTEM MALFUNCTION

P0627-0702

Fig. 120: Fuel Pump Control Module System - Circuit Diagram**General Description**

The fuel pump control module system monitors the voltage applied to the fuel pump in response to the duty signal from the powertrain control module (PCM). When the voltage applied to the fuel pump is normal, the fuel pump control module system outputs a high diagnosis signal, and when the voltage applied is abnormal, it outputs a low signal. The PCM monitors this diagnosis signal whenever the engine is running.

When the diagnosis signal from the fuel pump control module system is low for a set time or more, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Continuous
Sequence	None

Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P062F (0): ADVANCED DIAGNOSTICS

DTC P062F: POWERTRAIN CONTROL MODULE (PCM) INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR (EXCEPT PGM-FI SYSTEM)

Fig. 121: Powertrain Control Module (PCM) Internal Control Module - Communication Diagram

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

General Description (Except PGM-FI System)

The powertrain control module (PCM) is equipped with a keep-alive memory. The data (control learn data, etc.) for powertrain control and information (vehicle identification number (VIN), etc.) related to vehicle control is stored in the keep alive memory, so that it can be maintained even when power is not supplied to the PCM, such as when the battery is disconnected. When power is restored to the PCM, the CPU retrieves the stored information from the keep-alive memory, but when the data retrieval process is not finished normally, a malfunction is detected and a DTC is stored.

The CPU writes data to the keep-alive memory from the CPU: Control related data is written when the ignition is turned on, and vehicle information when commanded from the HDS.

If the data writing process is not completed normally, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status (Except PGM-FI System)

Diagnosis Details (PGM-FI System)**Conditions for illuminating the MIL (PGM-FI System)**

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL (PGM-FI System)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0630 (139): ADVANCED DIAGNOSTICS**DTC P0630: VIN NOT PROGRAMMED OR MISMATCH**

P0630-0571

Fig. 123: VIN Not Programmed Or Mismatch - Communication Diagram

General Description

The powertrain control module (PCM) stores a vehicle identification number (VIN) in the keep-alive memory and outputs the VIN according to the command from the HDS.

The VIN for each vehicle is registered to the PCM using the HDS. The registered VIN is read by the CPU from the keep-alive memory after the ignition is turned on or after the Clear command is executed.

If the VIN is not registered in the keep-alive memory when the ignition is turned on or when the Clear command is executed, it is detected as a VIN unregistered condition and a DTC is stored.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

When the VIN registration is completed, the MIL is cleared.

DTC P0685 (135): ADVANCED DIAGNOSTICS

DTC P0685: POWERTRAIN CONTROL MODULE (PCM) POWER CONTROL
CIRCUIT/INTERNAL CIRCUIT MALFUNCTION

P0685-0702

Fig. 124: Powertrain Control Module (PCM) Power Control - Circuit Diagram

General Description

After the ignition switch is turned off, the powertrain control module (PCM) does not shut down immediately. After finishing a predetermined process according to the request of each device and system, the power supply is automatically disconnected (self shut-down function). The PCM power is disconnected by controlling PGM-FI main relay 1.

During a normal PCM shut down, the shut down process is executed by the CPU, PGM-FI main relay 1 is turned off, and the voltage to the PCM is turned off to shut down the PCM. When the voltage to the PCM is turned off and the PCM shuts down without the normal shut down procedure, a malfunction in the PGM-FI main relay 1 control circuit is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive drive cycles in which the engine conditions are similar to the first time the malfunction was detected.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0705 (5): ADVANCED DIAGNOSTICS

DTC P0705: SHORT IN TRANSMISSION RANGE SWITCH CIRCUIT (MULTIPLE SHIFT-POSITION INPUT)

P0705-0503

Fig. 125: Short In Transmission Range Switch (Multiple Shift-Position Input) - Circuit Diagram

TRANSMISSION RANGE SWITCH SPECIFICATION

Shift lever position	Input per switch						
	P	R	N	D	D3	FWD	RVS
P	o	X	X	X	X	X	o
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	o
D	X	X	X	o	X	o	X
D3	X	X	X	X	o	o	X

o: Closed X: Open

General Description

The transmission range switch is attached to the control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the Low/High signal combinations which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the PCM detects multiple switch inputs instead of the correct switch input for the selected range at that time, it detects a malfunction and stores a DTC.

Battery voltage	11.0 V	-

Malfunction Threshold

One of these conditions occurs.

- The PCM detects the selected range switch input and another range switch input simultaneously for at least 1 second.
- The PCM detects the P, R, or N range switch input and the FWD switch input simultaneously for at least 1 second.
- The PCM detects the D or D3 range switch input and the RVS switch input simultaneously for at least 1 second.

Driving Pattern

Start the engine, and then place the shift lever in each position for at least 1 second.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0706 (6): ADVANCED DIAGNOSTICS

DTC P0706: OPEN IN TRANSMISSION RANGE SWITCH CIRCUIT

P0705-0503

Fig. 126: Open In Transmission Range Switch - Circuit Diagram**TRANSMISSION RANGE SWITCH SPECIFICATION**

Shift lever position	Input per switch						
	P	R	N	D	D3	FWD	RVS
P	o	X	X	X	X	X	o
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	o
D	X	X	X	o	X	o	X
D3	X	X	X	X	o	o	X

o: Closed X: Open

General Description

The transmission range switch is attached to the control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the Low/High signal combinations which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the FWD switch stays open while the vehicle repeatedly accelerates to a specified vehicle speed and then stops despite being in the D position, the PCM detects a malfunction in the transmission range switch (open) and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	Depending on the driving pattern
DTC Type	Two drive cycles, MIL ON, D indicator OFF
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0705, P0721, P0722	

Malfunction Threshold

No FWD position signal is detected when the vehicle speed changes from 6 mph (10 km/h) --> 25 mph (40 km/h) --> 6 mph (10 km/h) in the D or D3 position.

Driving Pattern

1. Start the engine, and accelerate to 25 mph (40 km/h) or more in the D position, then slow down to 6 mph (10 km/h).
2. Stop the vehicle, turn the ignition switch OFF, and repeat step 1.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0711 (28): ADVANCED DIAGNOSTICS

DTC P0711: PROBLEM IN ATF TEMPERATURE SENSOR CIRCUIT

P0711-0301

Fig. 127: ATF Temperature Sensor - Circuit Diagram

1. Stuck at the low temperature

2. Stuck at the high temperature

P0711-0370

Fig. 128: ATF Temperature Sensor - Temperature Graph

General Description

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage.

If the ATF temperature sensor signal does not change, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle

Present engine coolant temperature when the ignition switch is turned ON	-	95°F (35°C) ⁽²⁾
No active DTCs	P0116, P0117, P0118, P0712, P0713, P0721, P0722	
Other	After the engine coolant temperature reaches the fixed value, both the vehicle speed and the throttle position meet the conditions for at least 5 minutes ⁽¹⁾	

(1) Stuck at Low temperature

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

(2) Stuck at High temperature

Malfunction Threshold

1. Stuck at Low temperature

The ATF temperature rise is 9°F (5°C) or less after the ignition switch is turned ON, and the current ATF temperature is -4°F (-20°C) or less for at least 5 minutes.

2. Stuck at High temperature

The ATF temperature drop is -9°F (-5°C) or less after the ignition switch is turned OFF, and the current ATF temperature is 230°F (110°C) or more for at least 20 seconds.

Driving Pattern

1. Stuck at Low temperature

Start the engine with engine coolant temperature at 95°F (35°C) or less, and warm up the engine until the engine coolant temperature reaches 158°F (70°C) or more. Then drive the vehicle at a speed of 19 mph (30 km/h) or more with the throttle position at 4.0° or more for at least 5 minutes.

2. Stuck at High temperature

Turn off the engine with the engine coolant temperature at 158°F (70°C) or more. Restart the engine after the engine coolant temperature drops to 95°F (35°C) or less, and warm up the engine until the engine coolant temperature reaches 158°F (70°C), and wait for at least 20 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0712 (28): ADVANCED DIAGNOSTICS

DTC P0712: SHORT IN ATF TEMPERATURE SENSOR CIRCUIT

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

P0711-0301

Fig. 129: Short In ATF Temperature Sensor - Circuit Diagram

General Description

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage.

When the ATF temperature sensor signal voltage to the PCM is under the specification, indicating that the temperature is above the specification (a short to ground), a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0711, P0713	

Malfunction Threshold

The ATF temperature sensor output voltage is less than 0.07 V for at least 10 seconds.

Driving Pattern

Start the engine, shift to the P position, and wait for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0713 (28): ADVANCED DIAGNOSTICS

DTC P0713: OPEN IN ATF TEMPERATURE SENSOR CIRCUIT

Fig. 130: Open In ATF Temperature Sensor - Circuit Diagram

General Description

The ATF temperature sensor is a thermistor type sensor whose resistance changes according to the change in ATF temperature. The powertrain control module (PCM) sends a 5 V reference voltage to the grounded sensor through a pull-up resistor. When the ATF temperature is low, the sensor resistance increases and the PCM detects a high signal voltage. As the ATF temperature rises, the sensor resistance decreases and the PCM detects a low signal voltage.

When the ATF temperature sensor signal voltage to the PCM is above the specification, indicating that the temperature is under the specification (open), a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None

Duration	10 seconds or more
DTC Type	One drive cycle, MIL OFF, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0711, P0712	

Malfunction Threshold

The ATF temperature sensor output voltage is 4.93 V or more for at least 10 seconds.

Driving Pattern

Start the engine, shift to the P position, and wait for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the D indicator blinks, and the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0716 (15): ADVANCED DIAGNOSTICS

DTC P0716: PROBLEM IN INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT

Fig. 131: Problem In Input Shaft (Mainshaft) Speed Sensor - Circuit Diagram**Failure Area**

P0716-0470

Fig. 132: Input Shaft (Mainshaft) Speed Graph**General Description**

The input shaft (mainshaft) speed sensor is attached to the outside of the transmission housing. The input shaft (mainshaft) speed sensor generates a pulsing signal according to the speed of the input shaft (mainshaft) idler gear on the input shaft (mainshaft). Using that signal, the powertrain control module (PCM) determines the speed of the input shaft (mainshaft). If no pulses occur with the input shaft (mainshaft) rotating, the PCM detects a malfunction that may be caused by an open, a temporary open, or a short to ground. Based on the velocity ratio measured by the output shaft (countershaft) speed sensor and the input shaft (mainshaft) speed sensor, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0731 (64): ADVANCED DIAGNOSTICS

DTC P0731: PROBLEM IN 1ST CLUTCH AND 1ST CLUTCH HYDRAULIC CIRCUIT (1ST GEAR INCORRECT RATIO)

P0731-0370

Fig. 143: 1st Clutch And 1st Clutch Hydraulic Diagnostic Flow

SYMPTOM 1

P0731-0570

Fig. 144: Gear Ratio To Shift Status Graph (1 Of 2)

SYMPTOM 2

P0731-0571

Fig. 145: Gear Ratio To Shift Status Graph (2 Of 2)

General Description

To engage 1st gear, line pressure is supplied to the 1st clutch piston, engaging the 1st clutch, and the secondary shaft and the secondary shaft 1st gear are connected and revolve together. Hydraulic pressure is supplied to the 1st clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 1st clutch piston. (A shift valve failure in the supply route above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 1st gear

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

ratio, it is detected as a malfunction of the hydraulic circuit or the 1st clutch, and a DTC is stored.

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Malfunction Threshold

Symptom 1

The actual gear ratio must match one of these conditions for at least 12 seconds with the 1st gear command:

- Actual gear ratio is greater than the 1st gear ratio by a factor of 1.2
- Actual gear ratio is less than the 1st gear ratio by a factor of 0.75

Symptom 2

The actual gear position is neutral for at least 3 seconds and then the gear up-shifted from 2nd to 3rd, even though 1st gear shift is commanded.

Driving Pattern

Symptom 1

Start the engine, shift to D position, and drive the vehicle at a speed of 8 mph (12 km/h) or more for at least 12 seconds in 1st gear.

Symptom 2 (When the vehicle does not start at 1st gear)

1. Start the engine.
 2. Shift to D position, and open the accelerator pedal about 3% for at least 5 seconds.
 3. Release the accelerator pedal until the engine speed drops 1,000 rpm or less.
 4. Press the accelerator pedal again, and drive the vehicle so that the transmission shifts from 2nd to 3rd gear.
- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the DTC and the freeze frame data are stored. The MIL does not come on.

Conditions for clearing the MIL

The DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0732 (64): ADVANCED DIAGNOSTICS

DTC P0732: PROBLEM IN 2ND CLUTCH AND 2ND CLUTCH HYDRAULIC CIRCUIT (2ND GEAR INCORRECT RATIO)

P0732-0370

Fig. 146: 2nd Clutch And 2nd Clutch Hydraulic Diagnostic Flow

P0732-0371

Fig. 147: Gear Ratio To Shift Status Graph

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

General Description

To engage 2nd gear, line pressure is supplied to the 2nd clutch piston, engaging the 2nd clutch, and the secondary shaft and the secondary shaft 2nd gear are connected and revolve together. Hydraulic pressure is supplied to the 2nd clutch through the ATF strainer --> the ATF pump --> the regulator valve --> the manual valve --> the shift valves --> the feed pipe --> 2nd clutch piston. (A shift valve failure in the supply route above is detected by the malfunction detection of each shift solenoid valve.) The powertrain control module (PCM) computes the ratio of the input shaft (mainshaft) speed to the output shaft (countershaft) speed. When the ratio is not the 2nd gear ratio, it is detected as a malfunction of the hydraulic circuit or the 2nd clutch, and a DTC is stored.

DTC P0741 (40): ADVANCED DIAGNOSTICS

DTC P0741: TORQUE CONVERTER CLUTCH HYDRAULIC CIRCUIT STUCK OFF

Fig. 154: Torque Converter Clutch Hydraulic (Stuck OFF) - System Diagram

TORQUE CONVERTER CLUTCH OPERATION CHART

Torque converter clutch operation		A/T clutch pressure control solenoid valve C	
		ON (100 %)	OFF (0 %)
Shift solenoid valve D	ON (12 V)	Torque converter clutch: maximum duty	Torque converter clutch OFF
	OFF (0 V)	Torque converter clutch OFF	Torque converter clutch

		OFF
--	--	-----

General Description

The power transfer capacity of the torque converter clutch is controlled by the balance of automatic transmission fluid (ATF) supply to and discharge from the torque converter. When hydraulic pressure is applied internally, the torque converter clutch turns ON, and when hydraulic pressure is applied from the back pressure side, the torque converter clutch turns OFF. As the hydraulic pressure from the internal pressure side increases, the power transfer capacity of the torque converter clutch increases. The direction of hydraulic pressure supply is switched by the torque converter clutch and the lock-up shift valve. ATF is supplied from the internal pressure side to shift solenoid valve D when the signal from the powertrain control module (PCM) is ON (12 V), and ATF is supplied from the back pressure side when it is OFF (0 V). The balance of internal pressure and back pressure is controlled by A/T clutch pressure control solenoid valve B, the lock-up control valve, and the lock-up timing valve. A/T clutch pressure control solenoid valve C maximizes the power transfer capacity of the torque converter clutch when the signal from the PCM is ON (1 A), and it minimizes the power transfer capacity of the torque converter clutch when the signal from the PCM is OFF (0 A). If the ratio of engine speed and input shaft (mainshaft) speed is not about 1:1 while the PCM is issuing the command to turn shift solenoid valve D and A/T clutch pressure control solenoid valve C ON, the PCM detects a faulty lock-up control system and stores a DTC.

	When both the vehicle speed and the throttle position are in Enable Range	

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Malfunction Threshold

The ratio of the engine revolutions to the transmission input pulses does not reach about 100% for at least 22 seconds.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a constant speed of 60 mph (96 km/h) for at least 22 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 157: Shift Solenoid Valve And Clutch Specification Chart

General Description

A/T clutch pressure control solenoid valve A is installed in the transmission housing. A/T clutch pressure control solenoid valve A is operated by the powertrain control module (PCM) and converts the modulated pressure to A/T clutch pressure control solenoid A pressure, which operates CPC valve A. Line pressure is modulated to clutch pressure control A pressure (CPC A pressure) by CPC valve A and the CPC valve A spring. A signal from the PCM is output to the proper gear clutch, determined by the gear schedule, to supply the proper CPC pressure according to the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve A operates and the CPC valve A pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve A turns off and CPC valve A pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the

2008 Acura MDX
2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

predetermined gear ratio, an A/T clutch pressure control solenoid valve A OFF failure is detected and a DTC is stored.

(1) Symptom 2		

Malfunction Threshold

One of these symptom occurs:

- Driven in 3rd gear with a history that symptom 1 occurred.
- Symptom 2 occurs.

SYMPTOM CHART

Symptom	Gear position commanded by the PCM	Actual gear position
1	1st --> 2nd gear upshift	Driving in 1st gear

SYMPTOM CHART

--	--	--

Symptom	Gear position commanded by the PCM	Actual gear position
2-A	2nd --> 3rd gear upshift	The engine speed flares when upshifting to 2nd - 3rd
2-B	3rd --> 4th gear upshift	The engine speed flares when upshifting to 3rd - 4th

Driving Pattern

Start the engine, and accelerate the vehicle until the transmission shifts into 5th gear in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 160: Shift Solenoid Valve And Clutch Specification Chart

General Description

A/T clutch pressure control solenoid valve A is installed in the transmission housing. A/T clutch pressure control solenoid valve A is operated by the powertrain control module (PCM) and converts the modulated pressure to A/T clutch pressure control solenoid A pressure, which operates CPC valve A. Line pressure is modulated to clutch pressure control A pressure (CPC A pressure) by CPC valve A and the CPC valve A spring. A signal from the PCM is output to the proper gear clutch, determined by the gear schedule, to supply the proper CPC pressure according to the driving conditions. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve A operates and the CPC valve A pressure increases. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve A turns off and CPC valve A pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear ratio, an A/T clutch pressure control solenoid valve A ON failure is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	20 seconds
DTC Type	Two drive cycles, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Malfunction Threshold

One of these conditions occurs.

- The transmission is held in 2nd gear against the 2nd --> 3rd gear upshift command as long as 20 seconds though there is no record of being neutral when the 1st gear shift is commanded.
- The transmission is held in 4th gear against the 4th --> 5th gear upshift command as long as 20 seconds though there is no record of being neutral when the 1st gear shift is commanded.

Driving Pattern

Start the engine, and accelerate the vehicle until the transmission shifts into 5th gear in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

General Description

Shift solenoid valve A is installed in the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM), to apply modulated pressure to shift valve A. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. When the signal to shift solenoid valve A from the PCM is ON, and modulated pressure is discharged, shift valve A is inactive. When the signal to shift solenoid valve A from the PCM is OFF, and modulated pressure is applied to shift valve A, it operates against the shift valve A spring. The PCM monitors the mainshaft speed and the countershaft speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift solenoid valve A OFF failure is detected and a DTC is stored.

Fig. 181: Shift Solenoid Valve And Gear Position Specification Chart

General Description

Shift solenoid valve D is installed in the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply modulated pressure to lock-up shift valve. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. When the signal to shift solenoid valve D from the PCM is ON, and modulated pressure is applied to the lock-up shift valve, it operates against the lock-up shift valve spring. When the signal to shift solenoid valve D from the PCM is OFF, and modulated pressure is discharged, the lock-up shift valve is inactive. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift solenoid valve D OFF failure is detected and a DTC is stored.

Malfunction Threshold

One of these symptoms occurs:

SYMPTOM CHART (1 OF 2)

Symptom	Gear position commanded by the PCM	Actual gear position
1	3rd --> 4th gear upshift	Turn on the 2nd clutch transmission fluid switch

SYMPTOM CHART (2 OF 2)

Symptom	Gear position commanded by the PCM	Actual gear position
2-A	Reverse gear in-gear	Neutral
2-B	Driving in Reverse gear	Neutral

Driving Pattern

Start the engine, and accelerate the vehicle until the transmission shifts into 5th gear in the D position.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

Fig. 183: Shift Solenoid Valve And Gear Position Specification Chart

General Description

Shift solenoid valve D is installed in the transmission housing. It is controlled by the ON/OFF signal from the powertrain control module (PCM) to apply modulated pressure to the lock-up shift valve. The signal from the PCM is output to apply clutch pressure control pressure to the proper gear change clutch according to the gear change schedule. When the signal to shift solenoid valve D from the PCM is OFF, and modulated pressure is discharged, the lock-up shift valve is inactive. When the signal to shift solenoid valve D from the PCM is ON, and modulated pressure is applied to lock-up shift valve, it operates against the lock-up shift valve spring. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift solenoid valve D ON failure is detected and a DTC is stored.

CPC: Clutch Pressure Control pressure

Fig. 186: Shift Solenoid Valve And Clutch Specification Chart

General Description

A/T clutch pressure control solenoid valve B is installed in the transmission housing. A/T clutch pressure control solenoid valve B is operated by the powertrain control module (PCM) and converts modulated pressure to A/T clutch pressure control solenoid B pressure, which operates CPC valve B. Line pressure is modulated to clutch pressure control B pressure (CPC B pressure) by CPC valve B and the CPC valve B spring. A signal from the PCM is output to the proper gear clutch, determined by the gear schedule, to supply the proper CPC pressure according to the driving conditions. When the current from the PCM is low (OFF), A/T clutch pressure control solenoid valve B operates and the CPC valve B pressure increases. When the current from the PCM is high (ON), A/T clutch pressure control solenoid valve B turns off and the CPC valve B pressure decreases. The PCM monitors the input shaft (mainshaft) speed and the output shaft (countershaft) speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, an A/T clutch pressure control solenoid valve B OFF failure is detected and a DTC is stored.

D3	X	X	X	X	o	o	X

o: Closed X: Open

General Description

The transmission range switch is attached to the control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the Low/High signal combinations which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the R switch is OPEN with the shift lever in the R position, the PCM detects a switch OPEN failure and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	Depending on the driving pattern
DTC Type	Two drive cycles, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
Engine speed	1,000 rpm	-
Shift lever position	R	
No active DTCs	P0705, P0716, P0717, P0721, P0722, P1717	

Malfunction Threshold

The RVS signal is detected but the R signal is not detected for at least 2 seconds.

Driving Pattern

- 1. Start the engine, shift to the R position, and drive the vehicle at a speed of 3 mph (5 km/h) or less for at least 2 seconds.
- 2. Drive the vehicle at a speed of 3 mph (5 km/h) or more for at least 2 seconds in the R position.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0815 (24): ADVANCED DIAGNOSTICS

DTC P0815: SHORT IN TRANSMISSION GEAR SELECTION SWITCH UPSHIFT SWITCH

CIRCUIT, OR TRANSMISSION GEAR SELECTION SWITCH UPSHIFT SWITCH STUCK ON

P0815-0701

Fig. 196: Short In Transmission Gear Selection Switch Upshift Switch - Circuit Diagram

P0815-0770

Fig. 197: Identifying Transmission Gear Shifting UP Position

General Description

When the shift lever is moved to the M position (the sequential sportshift mode (S-MODE) is selected), the upshift (S-UP) switch and the downshift (S-DN) switch can be used. When the shift lever is moved toward the S-UP switch, an upshift is executed, and when the shift lever is moved toward the S-DN switch, a downshift is executed. The S-MODE switch signal, the S-UP switch signal, and the S-DN switch signal are grounded when turned on and opened when turned off.

When the S-UP switch is turned on in the P, R, N, and D3 positions, a malfunction of the S-UP switch is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0705, P0706, P0816, P0957, P0958	

Malfunction Threshold

The S-UP switch signal is turned on in the P, R, N, and D3 positions for at least 10 seconds.

Driving Pattern

Start the engine, shift to the P position, and wait for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0816 (24): ADVANCED DIAGNOSTICS

DTC P0816: SHORT IN TRANSMISSION GEAR SELECTION SWITCH DOWNSHIFT SWITCH CIRCUIT, OR TRANSMISSION GEAR SELECTION SWITCH DOWNSHIFT SWITCH STUCK ON

P0815-0701

Fig. 198: Short In Transmission Gear Selection Switch Downshift Switch - Circuit Diagram

P0816-0770

Fig. 199: Identifying Transmission Gear Shifting Down Position

General Description

When the shift lever is moved to the M position (the sequential sportshift mode (S-MODE) is selected), the upshift (S-UP) switch and the downshift (S-DN) switch can be used. When the shift lever is moved toward the S-UP switch, an upshift is executed, and when the shift lever is moved toward the S-DN switch, a downshift is executed. The S-MODE switch signal, the S-UP switch signal, and the S-DN switch signal are grounded when turned on and opened when turned off.

When the S-DN switch is turned on in the P, R, N, and D3 positions, a malfunction of the S-DN switch is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0705, P0706, P0815, P0957, P0958	

Malfunction Threshold

The S-DN switch signal is turned on in the P, R, N, and D3 positions for at least 10 seconds.

Driving Pattern

Start the engine, shift to the P position, and wait for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0842 (25): ADVANCED DIAGNOSTICS

DTC P0842: SHORT IN 2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CIRCUIT, OR 2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH STUCK ON

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

P0842-0801

Fig. 200: Short In 2nd Clutch Transmission Fluid Pressure Switch - Circuit Diagram

P0842-0870

Fig. 201: Gear Position To Shift Status Graph

General Description

The 2nd clutch transmission fluid pressure switch is installed in the hydraulic pressure circuit to the 2nd clutch. When hydraulic pressure is supplied to the 2nd clutch, the switch is turned ON. When hydraulic pressure is not supplied to the 2nd clutch, the switch is turned OFF. The signal from the 2nd clutch transmission fluid pressure switch is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 2nd gear (1st-->2nd, 3rd-->2nd) to reduce the shock that occurs at the gear change.

If the 2nd clutch transmission fluid pressure switch is ON while driving the vehicle with the speed ratio of the output shaft (countershaft) to the input shaft (mainshaft) other than the 2nd ratio, the PCM detects a 2nd clutch transmission fluid pressure switch failure and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous

No active DTCs	P0122, P0123, P0705, P0716, P0717, P0721, P0722, P0746, P0747, P0751, P0752, P0756, P0757, P0761, P0762, P0766, P0767, P0776, P0777, P0796, P0797, P0843, P0847, P0848, P0962, P0963, P0966, P0967, P0970, P0971, P0973, P0974, P0976, P0977, P0979, P0980, P0982, P0983, P1743, P1744, P1745, P1780	
Others	Not during shifting	

Malfunction Threshold

The input signal from the 2nd clutch transmission fluid pressure switch to the PCM is low when driving in 1st gear, 3rd gear, or 5th gear.

Driving Pattern

Start the engine, and drive the vehicle in the D position and 3rd gear for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0843 (25): ADVANCED DIAGNOSTICS

DTC P0843: OPEN IN 2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CIRCUIT, OR

2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH STUCK OFF

P0842-0801

Fig. 202: Open In 2nd Clutch Transmission Fluid Pressure Switch - Circuit Diagram

P0843-0370

Fig. 203: Gear Position To Shift Status Graph

General Description

The 2nd clutch transmission fluid pressure switch is installed in the hydraulic pressure circuit to the 2nd clutch. When hydraulic pressure is supplied to the 2nd clutch, the switch is turned ON. When hydraulic pressure is not supplied to the 2nd clutch, the switch is turned OFF. The signal from the 2nd clutch transmission fluid pressure switch is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 2nd gear (1st --> 2nd, 3rd --> 2nd) to reduce the shock that occurs at the gear change. If the 2nd clutch transmission fluid pressure switch is OFF while the rotation speed ratio of the input/output pulses is that of 2nd gear, the PCM detects a malfunction in the 2nd clutch transmission fluid pressure switch and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Others	Not during shifting	

Malfunction Threshold

The input signal from the 2nd clutch transmission fluid pressure switch to the PCM is high when driving in 2nd gear.

Driving Pattern

Start the engine, and drive the vehicle in the D position and 2nd gear for at least 2 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0847 (26): ADVANCED DIAGNOSTICS

DTC P0847: SHORT IN 3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH CIRCUIT, OR

3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH STUCK ON

P0847-0801

Fig. 204: Short In 3rd Clutch Transmission Fluid Pressure Switch - Circuit Diagram

P0847-0870

Fig. 205: Gear Position To Shift Status Graph

General Description

The 3rd clutch transmission fluid pressure switch is installed in the hydraulic pressure circuit to the 3rd clutch. When hydraulic pressure is supplied to the 3rd clutch, the switch is turned ON. When hydraulic pressure is not supplied to the 3rd clutch, the switch is turned OFF. The signal from the 3rd clutch transmission fluid pressure switch is input to the powertrain control module (PCM). The PCM detects the hydraulic pressure supply conditions at the gear change to 3rd gear (2nd --> 3rd, 4th --> 3rd) to reduce the shock that occurs at the gear change.

If the 3rd clutch transmission fluid pressure switch is ON while driving, and the speed ratio of the output shaft (countershaft) to the input shaft (mainshaft) is other than the 3rd ratio, the PCM detects a 3rd clutch transmission fluid pressure switch failure, and a DTC is stored.

No active DTCs	P0705, P0706, P0815, P0816, P0957	

Malfunction Threshold

The S-UP switch inputs or S-DN switch inputs are counted at least two times when the S-MODE switch signal is turned off in the D position.

Driving Pattern

Start the engine, switch the shift lever to S-MODE, and operate the S-UP and S-DN switches at least twice.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P0962 (16): ADVANCED DIAGNOSTICS

DTC P0962: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CIRCUIT

P0962-0302

Fig. 216: Problem In A/T Clutch Pressure Control Solenoid Valve A - Circuit Diagram

P0962-0370

Fig. 217: A/T Clutch Pressure Control Solenoid Valve Current Graph

General Description

A/T clutch pressure control solenoid valve A is used for clutch pressure control. A spool in A/T clutch pressure control solenoid valve A pushes a valve according to the duty cycle that is controlled by the powertrain control module (PCM) so the hydraulic pressure is proportional to the current. The PCM measures the current flowing through A/T clutch pressure control solenoid valve A and uses feedback control to compensate for the difference between the actual current and the commanded one. If the measured current for the PCM output duty cycle is not within a specified range (open or short), a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0963, P0966, P0967, P0970, P0971	

Malfunction Threshold

The measured current for the PCM's command value is as specified here for at least 1 second.

MALFUNCTION THRESHOLD CHART

Duty (%)	Current (A)	Failure mode
57 - 89	Less than 0.2	Low Input
More than 89	Less than 0.4	Low Input

Driving Pattern

Start the engine, and wait for at least 1 second.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

Fig. 229: Shift Solenoid Valve And Gear Position Specification Chart

General Description

When shift solenoid valves A and D are turned ON, the hydraulic pressure circuit opens. When shift solenoid valves B and C are turned OFF, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of those valves and the shift valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. A malfunction is detected when the return signal does not match the PCM command to turn ON the shift solenoid valve, and a DTC is stored.

4th - 5th	OFF	OFF	ON	OFF/ON
5th	OFF	ON	ON	OFF/ON

Fig. 241: Shift Solenoid Valve And Gear Position Specification Chart

General Description

When shift solenoid valves A and D are turned ON, the hydraulic pressure circuit opens. When shift solenoid valves B and C are turned OFF, the hydraulic pressure circuit opens. The hydraulic pressure circuit supplies/discharges hydraulic pressure to/from each clutch according to the combination of the ON/OFF status of those valves and the shift valves. The powertrain control module (PCM) commands the driver circuit to turn on the shift solenoid valve. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the PCM's command. A malfunction is detected when the return signal does not match the PCM command to turn ON the shift solenoid valve, and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

Malfunction Threshold

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

The return signal does not match the command to turn OFF shift solenoid valve D for at least 1 second.

Driving Pattern

Start the engine, shift to the N position, and wait for at least 1 second.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1077 (106): ADVANCED DIAGNOSTICS

DTC P1077: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN HIGH RPM POSITION

P1077-0572

Fig. 244: Identifying DTC P1077 Intake Manifold Tuning (IMT) Valve Position

General Description

The intake manifold tuning (IMT) system controls engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the PCM. The IMT actuator sends a long runner return signal to the PCM when the IMT valve is closed, and it sends a short runner return signal when the IMT valve is open.

If the PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	7 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Intake air temperature	5°F (-15°C)	-
Engine speed	-	3,600 rpm
Battery voltage	10.5 V	-
No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0563, P1128, P1129, P2227, P2228, P2229	

Malfunction Threshold

When the PCM sends a close (long runner) command, no long runner return signal is received for at least 7 seconds.

Driving Pattern

1. Start the engine. Let it idle until the radiator fan comes on.
2. Let the engine idle for at least 7 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1078 (106): ADVANCED DIAGNOSTICS

DTC P1078: INTAKE MANIFOLD TUNING (IMT) VALVE STUCK IN LOW RPM POSITION

P1077-0572

Fig. 245: Intake Manifold Tuning (IMT) Valve Position**General Description**

The intake manifold tuning (IMT) system controls engine output by selecting either long or short intake runner lengths. The system consists of the IMT valve, the IMT actuator, and the powertrain control module (PCM). The IMT actuator is attached to the intake manifold and it includes the motor and the Hall-effect-IC position sensing unit. The PCM actuates the motor, which operates the IMT valve. When the IMT valve is closed, the long runner is selected, increasing torque at low engine speed. When the IMT valve is open, the short runner is selected, increasing torque at high engine speed. A Hall-effect-IC position sensing unit is integrated with the motor to provide precise open/close feedback to the PCM. The IMT actuator sends a long runner return signal to the PCM when the IMT valve is closed, and it sends a short runner return signal when the IMT valve is open.

If the PCM receives no closed return signal when it sends a close command, or if it receives no open return signal when sending an open command to the IMT actuator, for a specified time, it detects a malfunction and stores a DTC.

No active DTCs	P0107, P0108, P0112, P0113, P0117, P0118, P0563, P1128, P1129, P2227, P2228, P2229	

Malfunction Threshold

When the PCM sends an open (short runner) command, no short runner return signal is received for at least 3 seconds.

Driving Pattern

1. Start the engine. Let it idle until the radiator fan comes on.
2. Hold the engine speed to 3,800 rpm or more for at least 3 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1109 (13): ADVANCED DIAGNOSTICS**DTC P1109: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT OUT OF RANGE-HIGH**

P1107-9603

Fig. 246: Barometric Pressure (BARO) Sensor - Circuit Diagram

P1106-9671

Fig. 247: Barometric Pressure (BARO) Sensor Voltage Graph**General Description**

The barometric pressure (BARO) sensor is built into the powertrain control module (PCM) and monitors atmospheric pressure. The PCM estimates appropriate intake airflow from the manifold absolute pressure (MAP) sensor output voltage and BARO sensor output voltage. When BARO sensor output voltage is within the specified range, a malfunction is detected and a DTC is stored.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1116 (86): ADVANCED DIAGNOSTICS

DTC P1116: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE PROBLEM

P0111-0570

Fig. 248: Engine Coolant Temperature (ECT) Sensor 1 Performance Graph**General Description**

Two engine coolant temperature sensors and one intake air temperature sensor are used by the powertrain control module (PCM).

When the engine is stopped and enough time has passed, the temperature of the engine will equal the ambient temperature.

When an inappropriate temperature is detected after comparing the temperature readings of each sensor, a malfunction in the corresponding sensor is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Engine off time	6 hours	-
No active DTCs	P0111, P0112, P0113, P0116, P0117, P0118, P0125, P2183, P2184, P2185, P2610	

Malfunction Threshold

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 57°F (32°C) or more.
- When the temperature difference between the IAT and ECT2 is 30°F (17°C) or more.
- When the temperature difference between the ECT2 and ECT1 is 73°F (41°C) or more.

Driving Pattern

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1128 (5): ADVANCED DIAGNOSTICS

DTC P1128: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL LOWER THAN EXPECTED

P0107-9671

Fig. 249: Manifold Absolute Pressure (MAP) Sensor Voltage Graph

P1128-9771

Fig. 250: Manifold Absolute Pressure (MAP) Sensor Operation Graph

General Description

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (idling) and high signal voltage at low-vacuum (throttle valve wide open).

The powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor.

If the MAP sensor outputs lower voltage than expected, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Other		Other than during fuel cut-off operation	

Malfunction Threshold

The MAP sensor output is 33 kPa (9.8 in.Hg, 249 mmHg) or less for at least 2 seconds when atmospheric pressure is 52 kPa (15.4 in.Hg, 392 mmHg).

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed of 15 mph (24 km/h) or more with a throttle position as specified under Enable Conditions for at least 2 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If

the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1129 (5): ADVANCED DIAGNOSTICS

DTC P1129: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR SIGNAL HIGHER THAN EXPECTED

P0107-9671

Fig. 251: Manifold Absolute Pressure (MAP) Sensor Voltage Graph

Fig. 252: Manifold Absolute Pressure (MAP) Sensor Operation Graph

General Description

The manifold absolute pressure (MAP) sensor senses manifold absolute pressure (vacuum) and converts it into electrical signals. The MAP sensor outputs low signal voltage at high-vacuum (throttle valve closed) and high signal voltage at low-vacuum (throttle valve wide open).

The powertrain control module (PCM) compares a predetermined MAP value at a given throttle position and manifold absolute pressure to the output voltage value of the MAP sensor.

If the MAP sensor outputs high voltage during fuel cut-off operation for deceleration with the throttle valve fully closed, which should make the manifold absolute pressure lower, the PCM detects a malfunction and stores a DTC.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1454 (91): ADVANCED DIAGNOSTICS

DTC P1454: FUEL TANK PRESSURE (FTP) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

P1454-0570

Fig. 258: Fuel Tank Pressure (FTP) Sensor Performance Graph

Malfunction Judgment Flowchart of FTP Sensor and EVAP Canister Vent Shut Valve

P1454-0371

Fig. 259: Malfunction Judgment Flowchart Of FTP Sensor And EVAP Canister Vent Shut Valve

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

General Description

The fuel tank pressure is about 0 kPa (0 in.Hg, 0 mmHg) when starting a cold engine. When the fuel tank pressure (FTP) sensor output value is out of a specified range and the powertrain control module (PCM) judges that there's no other cause [no evaporative emission (EVAP) canister vent shut valve failure, etc.] of the FTP sensor zero point shift, the PCM detects an FTP sensor malfunction.

However, if the FTP sensor output when starting the engine is a prescribed negative value or less (excessive negative pressure is detected), the malfunction judgment should be done as follows because it is difficult to distinguish the FTP sensor zero point shift (P1454) from the EVAP canister vent shut valve failure (P2422).

1. If either Temporary DTC P1454 or P2422 is not stored, the PCM stores both DTCs.
2. If both P1454 and P2422 Temporary DTCs are stored and an excessive negative pressure is detected, both P1454 and P2422 DTCs are stored.
3. If either Temporary DTC P1454 or P2422 is stored and an excessive negative pressure is detected, the PCM stores the DTC of the temporary DTC that was stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	One per driving cycle
Sequence	P0452, P0453 are judged as OK
Duration	8 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Elapsed time after starting the engine	10 seconds	-
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0443, P0451, P0452, P0453, P0496, P0497, P0498, P0499, P1128, P1129, P1172, P1174, P145C, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2422	
Others	The EVAP canister vent shut valve has not been closing	
	Stopping the purge control	

Malfunction Threshold

One of these conditions is met.

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

- The FTP sensor output fluctuates by 0.6 kPa (0.1 in.Hg, 5 mmHg) or more, or -0.6 kPa (-0.1 in.Hg, -5 mmHg) or less for at least 3 seconds.
- The FTP sensor output value is -1.3 kPa (-0.3 in.Hg, -10 mmHg) or less for at least 3 seconds.

Confirmation Procedure with the HDS

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Driving Pattern

Start the engine, and let it idle until the radiator fan comes on.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P145C (90): ADVANCED DIAGNOSTICS

DTC P145C: EVAPORATIVE EMISSION (EVAP) SYSTEM PURGE FLOW MALFUNCTION

P145C-0770

Fig. 260: Evaporative Emission (EVAP) System - System Diagram

General Description

The fuel (vapor) vaporized in the fuel tank is stored in the canister temporarily and introduced in the engine through the evaporative emission (EVAP) canister purge valve. The powertrain control module (PCM) controls the amount of vapor introduced into the engine by repeatedly switching power to the EVAP canister purge valve at a constant frequency according to the condition of the engine.

< STEP 1 >

The EVAP canister purge valve opens normally (EVAP canister purge valve OPEN OK) and detects that the purge flow is normal when the pulse of the EVAP canister purge valve drive cycle is transmitted to the fuel tank pressure (FTP) sensor by the purge flow (pulse method).

OK determination: Pulse exists (P145C OK)

- P0497 Purge flow OK
- P0496 EVAP canister purge valve stuck Open OK

NG determination: No pulse (P145C NG)

- Either purge flow P0497 abnormality or P0496 EVAP canister purge valve OPEN failure.
- In this case, classify the failure part according to < STEP 2 >.

< STEP 2 >

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

If there is no pulse, it is determined as either no purge flow or the EVAP canister purge valve is stuck OPEN:

When the FTP sensor fluctuates from negative pressure to atmospheric pressure after the ignition is turned off:
P0496 EVAP canister purge valve stuck OPEN

When there is no fluctuation of the FTP sensor: P0497 purge flow NG

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Execution	Once per driving cycle
Sequence	None
Duration	31 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Low load duration time	10 seconds	-
Engine coolant temperature before EVAP purge control starts	140°F (60°C)	-
MAP value	-	54 kPa (16.1 in.Hg, 410 mmHg)
Battery voltage	10.5 V	-
EVAP canister purge valve Duty	30 %	80 %
Fuel trim	0.73	1.47
Fuel feedback	Closed loop at stoichiometric	
No active DTCs	P0107, P0101, P0102, P0103, P0108, P0117, P0118, P0134, P0135, P0154, P0155, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0443, P0451, P0452, P0453, P0496, P0498, P0499, P1128, P1129, P1172, P1174, P1454, P2195, P2197, P2227, P2228, P2229, P2237, P2238, P2240, P2241, P2243, P2245, P2247, P2249, P2251, P2252, P2254, P2255, P2422	

Malfunction Threshold

The pulses detected by the fuel tank pressure sensor are 0.01% or less for at least 31 seconds.

Confirmation Procedure with the HDS

Do the EVAP FUNCTION TEST in the INSPECTION MENU with the HDS.

Driving Pattern

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 77 seconds.
3. Turn off the ignition for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1549 (34): ADVANCED DIAGNOSTICS

DTC P1549: CHARGING SYSTEM HIGH VOLTAGE

Fig. 261: Charging System (High Voltage) - Circuit Diagram

General Description

The alternator is driven by the engine and generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the powertrain control module (PCM)). The alternator output signal is sent to the PCM, and it varies according to the battery's state of charge, the electrical load, and engine speed.

2008 Acura MDX
2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

When the IGP terminal voltage of the PCM is a set value or more for a set time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	60 seconds or more
DTC Type	One drive cycle, MIL OFF
OBD Status	N/A

Enable Conditions

Condition	Minimum	Maximum
Engine speed	500 rpm	-

Malfunction Threshold

The IGP terminal voltage is 16.0 V or more for at least 60 seconds.

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1658 (40): ADVANCED DIAGNOSTICS

DTC P1658: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY ON MALFUNCTION

P1658-0702

Fig. 262: Electronic Throttle Control System (ETCS) Control Relay ON - Circuit Diagram

General Description

The powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, the electronic throttle control system (ETCS) control relay, and the PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position.

The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

When the voltage is applied from the ETCS control relay to the IG1ETCS terminal for a set time after the ETCS control relay is turned off, the PCM detects a malfunction in the ETCS control relay power switch and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	2.0 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	8.0 V	-
Ignition switch	OFF	
No active DTCs	P1659, P2101, P2118, P2135, P2176	

Malfunction Threshold

The communication signal is input from the throttle actuator control module for at least 2.0 seconds, after the throttle actuator control module relay is turned off.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1659 (40): ADVANCED DIAGNOSTICS

DTC P1659: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) CONTROL RELAY OFF MALFUNCTION

P1658-0702

Fig. 263: Electronic Throttle Control System (ETCS) Control Relay OFF - Circuit Diagram**General Description**

The powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, the electronic throttle control system (ETCS) control relay, and the PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position.

The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

When the voltage from the ETCS control relay is not input for a set time after the ETCS control relay is turned on when the ignition is turned on, or when voltage is not applied for a set time when the throttle actuator is operating, a malfunction in the ETCS control relay power switch is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Once per driving cycle
Sequence	None
Duration	0.2 second or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
Ignition switch	ON	
No active DTCs	P2101, P2118, P2135, P2176	

Malfunction Threshold

The voltage is not applied from the throttle actuator controller relay for at least 0.2 second.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1683 (40): ADVANCED DIAGNOSTICS

DTC P1683: THROTTLE VALVE DEFAULT POSITION SPRING PERFORMANCE PROBLEM

Fig. 264: Throttle Valve Default Position Spring Performance Graph

General Description

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

The throttle valve default position spring is attached to the throttle valve gear. It opens the throttle valve to improve starting performance in cold conditions, or to retain minimum running performance in case of an electronic throttle control system failure.

If the throttle valve does not return to the default position when the throttle actuator control module moves the throttle actuator to the default position from the fully closed position, a malfunction is detected and the malfunction data is transmitted to the PCM. When the PCM receives the malfunction data from the throttle actuator control module, the PCM detects the malfunction of the throttle valve default position spring and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	2.5 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Engine coolant temperature	158°F (70°C)	-
Battery voltage	6.0 V	-
Ignition switch	OFF	
No active DTCs	P0117, P0118, P2101, P2118, P2135, P2176	

Malfunction Threshold

The throttle valve is at a position greater than +5° from the fully closed position, or at a position lower than +3° from the fully closed position, for at least 2.5 seconds.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1684 (40): ADVANCED DIAGNOSTICS

DTC P1684: THROTTLE VALVE RETURN SPRING PERFORMANCE PROBLEM

Fig. 265: Throttle Valve Return Spring Performance Graph

General Description

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

The throttle valve return spring is attached to the throttle valve gear to return the throttle valve to the default position. If the throttle valve does not return to the default position when the throttle actuator control module moves the throttle actuator to the default position from the middle position, a malfunction is detected and the malfunction data is transmitted to the PCM. When the PCM receives the malfunction data from the throttle actuator control module, the PCM detects the malfunction of the throttle valve return spring and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None

Ignition switch	OFF	
No active DTCs	P0117, P0118, P2101, P2118, P2135, P2176	

Malfunction Threshold

The throttle valve opening angle is 17° or more, or 11° or less, for at least 2.5 seconds.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Turn the ignition switch OFF.
3. Turn the ignition switch ON.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P16BB (116): ADVANCED DIAGNOSTICS

DTC P16BB: ALTERNATOR B TERMINAL CIRCUIT LOW VOLTAGE**Fig. 266: Alternator B Terminal (Low Voltage) - Circuit Diagram****General Description**

The alternator is driven by the engine and generates electricity to supply the necessary power to the electrical system and to charge the battery. The alternator voltage target values of 14.5 V and 12.5 V are achieved by switching the alternator control mode (controlled by the powertrain control module (PCM)). The alternator output signal is sent to the PCM, and it varies according to the battery's state of charge, the electrical load, and

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

the engine speed.

When the engine speed is a specified value and the IGP terminal voltage is below a set value when the alternator is in the 14.5 V mode, and the alternator power generation amount is within the set range and this condition continues more than a set time, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

the battery.

DTC P16BD (198): ADVANCED DIAGNOSTICS

DTC P16BD: STARTER CUT RELAY 2 MALFUNCTION

P0615-0701

Fig. 268: Starter Cut Relay 2 - Circuit Diagram

General Description

To prevent the starter from continuing to rotate due to a switching failure of the starter cut relay, two starter cut relays are connected in series.

When the input voltage of the STRLD terminal drops to a set voltage even when the starter cut relay output (STRLY) is turned off, the powertrain control module (PCM) detects a malfunction of starter cut relay 2 (ST CUT) and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Diagnosis Details

Conditions for illuminating the indicator

When a malfunction is detected, the DTC and the freeze frame data are stored in the PCM memory. The MIL does not come on.

Conditions for clearing the DTC

The DTC and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P16C0 (99): ADVANCED DIAGNOSTICS

DTC P16C0: POWERTRAIN CONTROL MODULE (PCM) A/T CONTROL SYSTEM INCOMPLETE UPDATE

P16C0-0570

Fig. 271: Powertrain Control Module (PCM) A/T Control System - Communication Diagram

General Description

The control program in the powertrain control module (PCM) has a rewriting function that can be done in the field. The program in the CPU is classified into a powertrain control program (re-writable program) and a program for the rewrite function (non-re-writable program), and the program rewrite function only rewrites the powertrain control program.

When the program rewriting process is not finished normally due to an irregular process, such as turning off the PCM power during the A/T CPU re-writing process, and the ignition switch is turned on again, the A/T CPU starts according to the rewriting function program, and this DTC is sent to the FI CPU via serial communication and stored in the PCM.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P1717 (99): ADVANCED DIAGNOSTICS

DTC P1717: OPEN IN TRANSMISSION RANGE SWITCH ATP RVS SWITCH CIRCUIT

P0705-0503

Fig. 272: Transmission Range Switch ATP RVS Switch - Circuit Diagram

TRANSMISSION RANGE SWITCH SPECIFICATION

Shift lever position	Input per switch						
	P	R	N	D	D3	FWD	RVS
P	o	X	X	X	X	X	o
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	o
D	X	X	X	o	X	o	X
D3	X	X	X	X	o	o	X

o: Closed X: Open

General Description

The transmission range switch is attached to the control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The A/T gear position indicator indicates which position is selected according to the Low/High signal combinations which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is 12 V (High) at the powertrain control module (PCM) input terminal when each transmission range switch position is open, and it is 0 V (Low) when each switch is closed. If the RVS switch is OPEN with the shift lever in the R position while shifting between the P, R, and N positions, the PCM detects a RVS switch OPEN failure and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

2008 Acura MDX
2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON, D indicator blinks
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	11.0 V	-
No active DTCs	P0705, P0812	

Malfunction Threshold

No RVS signal is detected with the shift lever in the R position while shifting between the P, R, and N positions.

Driving Pattern

1. Start the engine, and shift to the P, R, and N positions.
2. Shift to the R position, and wait for at least 2 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

CPC: Clutch Pressure Control pressure

Fig. 275: Shift Solenoid Valve And Clutch Specification Chart

General Description

Shift valve E is incorporated in the control circuit of the transmission. It is controlled by pressure from shift solenoid valve B, and it is locked by the line pressure. It switches off when shift solenoid valve B turns off and shift solenoid valve A turns on. The PCM monitors the mainshaft speed and the countershaft speed at the gear change determined by the shift schedule. When an improper gear ratio is output compared to the predetermined gear change mode, a shift valve E OFF failure is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

CPC: Clutch Pressure Control pressure

Fig. 281: Shift Solenoid Valve And Clutch Specification Chart

General Description

The servo control valve and the servo valve are incorporated into the control circuit of the transmission. The servo control valve and the servo valve operate when the shift lever is in the D, D3, or M position due to line pressure and turn off when the shift lever is in the P, R, or N position.

The PCM monitors the mainshaft speed and the countershaft speed at the gear change determined by the shift schedule.

When an improper gear ratio is output compared to the predetermined gear change mode, a servo control valve OFF or servo valve OFF failure is detected and a DTC is stored.

DTC P2101 (40): ADVANCED DIAGNOSTICS

DTC P2101: ELECTRONIC THROTTLE CONTROL SYSTEM (ETCS) MALFUNCTION

P0122-0503

Fig. 282: Electronic Throttle Control System (ETCS) - Circuit Diagram

General Description

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

The accelerator pedal position (APP) sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The target position signal is then transmitted to the throttle actuator control module.

The throttle actuator control module determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

The throttle actuator control module compares the throttle valve target opening angle and the actual throttle valve opening angle from TP sensor A, and when the difference exceeds the specification, the throttle actuator control module transmits the malfunction data to the PCM. When the PCM receives the malfunction data from the throttle actuator control module, the PCM detects the malfunction of the throttle actuator system and a DTC is stored.

DTC P2118 (40): ADVANCED DIAGNOSTICS

DTC P2118: THROTTLE ACTUATOR CURRENT RANGE/PERFORMANCE PROBLEM

P0122-0503

Fig. 283: Throttle Actuator Current Range - Circuit Diagram

General Description

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The target position signal is then transmitted to the throttle actuator control module.

The throttle actuator control module determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

When the output current to the throttle actuator exceeds the specification for a set time, the throttle actuator

control module detects a malfunction and transmits the malfunction data to the PCM. When the PCM receives the malfunction data from the throttle actuator control module, the PCM detects a malfunction of the throttle actuator system and stores a DTC.

DTC P2127 (37): ADVANCED DIAGNOSTICS

DTC P2127: ACCELERATOR PEDAL POSITION (APP) SENSOR B (THROTTLE POSITION (TP) SENSOR E) CIRCUIT LOW VOLTAGE

P2122-0700

Fig. 288: Accelerator Pedal Position (APP) Sensor B (Low Voltage) - Circuit Diagram

General Description

Accelerator pedal position (APP) sensor B is a part of the electronic throttle control system (ETCS), and it is used to convert the position of the accelerator pedal into electrical signals. Based on these signals, the powertrain control module (PCM) controls the throttle actuator so that the throttle position agrees with the accelerator pedal position. If the signal voltage from APP sensor B is a set value or less, the PCM detects a malfunction and stores a DTC.

Fig. 290: Throttle Position (TP) Sensor A/B Voltage Incorrect Correlation - Circuit Diagram

P2135-0371

Fig. 291: Throttle Position (TP) Sensor A/B Voltage Graph

General Description

The powertrain control module (PCM) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the accelerator pedal position (APP) sensor, and the PCM.

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position.

The PCM determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A, installed in the throttle body.

The PCM compares the voltages and the throttle valve positions of TP sensor A and TP sensor B. If the difference of the voltages or the throttle valve positions is a fixed value or below for a set time, the PCM detects a malfunction in the relationship between TP sensor A and TP sensor B, and stores a DTC.

DTC P2138 (37): ADVANCED DIAGNOSTICS**DTC P2138: ACCELERATOR PEDAL POSITION (APP) SENSOR A/B (THROTTLE POSITION (TP) SENSOR D/E) INCORRECT VOLTAGE CORRELATION**

P2122-0700

Fig. 292: Accelerator Pedal Position (APP) Sensor A/B Incorrect Voltage Correlation - Circuit Diagram

P2138-0371

Fig. 293: Accelerator Pedal Position (APP) Sensor A/B Voltage Graph

General Description

Accelerator pedal position (APP) sensor A and accelerator pedal position (APP) sensor B are potentiometers, and they are installed in the engine compartment. These sensor output voltages differ from each other.

APP sensors A and B are operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in APP sensors A and B and transmitted to the powertrain control module (PCM) to compute the target position. The target position signal is then transmitted to the throttle actuator control module.

APP sensor A is for the primary control, and APP sensor B is a back-up of APP sensor A in case it malfunctions. Both sensors compare their output voltage to each other for malfunction detection.

When the voltage difference of APP sensor B is out of a fixed range for a set time, the PCM detects a malfunction, and a DTC is stored.

One of these conditions must be met for at least 0.3 second.

- If the APP sensor B voltage exceeds the range from 0 V or less to 0.361 V or more when the APP sensor A voltage is 0.361 V.
- If the APP sensor B voltage exceeds the range from 2.319 V or less to 2.681 V or more when the APP sensor A voltage is 4.995 V.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2176 (40): ADVANCED DIAGNOSTICS

DTC P2176: THROTTLE ACTUATOR CONTROL SYSTEM IDLE POSITION NOT LEARNED

Fig. 294: Identifying Throttle Position

General Description

The electronic throttle control system (ETCS) controls the throttle valve opening. The system is composed of the throttle actuator, the throttle valve, throttle position (TP) sensors A and B, the throttle actuator control module, the throttle actuator control module relay, the accelerator pedal position (APP) sensor, and the powertrain control module (PCM).

The APP sensor is operated via the throttle cable to determine the accelerator opening value when the driver presses the accelerator pedal. The accelerator pedal opening value is converted to a signal in the APP sensor and transmitted to the PCM to compute the target position. The target position signal is then transmitted to the throttle actuator control module. The throttle actuator control module determines the throttle valve target position according to the signal received and operates the throttle actuator to move the throttle valve to the target position. The actual throttle valve position is determined by TP sensor A installed in the throttle body.

The throttle actuator control module transmits a signal to the throttle actuator and moves the throttle valve to the fully closed position to register the throttle valve fully closed position after the ignition switch is turned ON.

The throttle actuator control module detects the malfunction of the throttle actuator control system, and it transmits a malfunction signal to the PCM when the registration of the throttle valve fully closed position is not completed within a predetermined time or the registered value is out of predetermined range after the ignition switch is turned ON. When the PCM receives the malfunction data from the throttle actuator control module, the PCM detects a malfunction in the throttle actuator control system and stores a DTC.

Malfunction Threshold

A malfunction is detected if these three conditions are present after the engine and the ignition switch have been off for at least 6 hours:

- When the temperature difference between the IAT and ECT1 is 57°F (32°C) or more.
- When the temperature difference between the IAT and ECT2 is 30°F (17°C) or more.
- When the temperature difference between the ECT2 and ECT1 is 73°F (41°C) or more.

Driving Pattern

1. Turn the ignition off, and wait at least 6 hours.
2. Start the engine, and let it idle for at least 10 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2184 (192): ADVANCED DIAGNOSTICS

DTC P2184: ENGINE COOLANT TEMPERATURE (ECT) SENSOR 2 CIRCUIT LOW VOLTAGE

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

P2184-0502

Fig. 296: Engine Coolant Temperature (ECT) Sensor 2 (Low Voltage) - Circuit Diagram

P2184-0570

Fig. 297: Engine Coolant Temperature (ECT) Sensor Voltage Graph

General Description

Engine coolant temperature (ECT) sensor 2 is a thermistor attached to the radiator. The powertrain control module (PCM) applies voltage (about 5 V) to the ECT2 signal circuit through a pull up resistor. As the engine coolant temperature cools, ECT sensor 2 resistance increases, and the PCM detects a high signal voltage. As the engine coolant warms, the sensor resistance decreases, and the PCM detects a low ECT2 signal voltage.

If the ECT sensor 2 output voltage is less than a set value when the engine coolant temperature is high, the PCM detects a malfunction and a DTC is stored.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2195 (155): ADVANCED DIAGNOSTICS

DTC P2195: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) SIGNAL STUCK LEAN

Fig. 300: Rear Air/Fuel Ratio (A/F) Sensor Malfunction

General Description

When the rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is properly connected to the engine wire harness, but it is not installed in the exhaust pipe, the A/F feedback is not done properly even if the rear A/F sensor is active after starting the engine. Thus, the exhaust emissions increase.

When the rear A/F sensor output stays out of the normal range after the rear A/F sensor becomes active, the powertrain control module (PCM) detects that the rear A/F sensor is not properly installed and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

DTC P2227 (13): ADVANCED DIAGNOSTICS

DTC P2227: BAROMETRIC PRESSURE (BARO) SENSOR CIRCUIT RANGE/PERFORMANCE PROBLEM

P1106-9671

Fig. 302: Barometric Pressure (BARO) Sensor Voltage Graph

P1106-9771

Fig. 303: Barometric Pressure (BARO) Sensor Operation Graph

General Description

The barometric pressure (BARO) sensor is built into the powertrain control module (PCM) and monitors atmospheric pressure. When the throttle valve is wide open, the manifold absolute pressure (MAP) sensor output is nearly equal to the BARO sensor output. Making use of this characteristic, a malfunction can be detected in the BARO sensor output.

If the throttle position is beyond a value stored in the PCM that is used to detect "wide-open throttle," and if the difference between the MAP sensor output and the BARO sensor output is equal to or greater than a set value, a malfunction in the BARO sensor output is detected and a DTC is stored.

DTC P2237 (155): ADVANCED DIAGNOSTICS

DTC P2237: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) IP CIRCUIT HIGH VOLTAGE

Fig. 308: Rear Air/Fuel Ratio (A/F) Sensor (High Voltage) - Circuit Diagram

General Description

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the powertrain control module (PCM). The PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. The sensor includes the VS cell, the pump cell, the atmospheric reference cavity, the diffusion layer, and the heater, and it enables overall feedback control.

If the IPB1 terminal voltage is out of a specified range, the PCM detects a malfunction and stores a DTC.

DTC P2238: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) IP CIRCUIT LOW VOLTAGE

Fig. 309: Rear Air/Fuel Ratio (A/F) Sensor (Low Voltage) - Circuit Diagram

General Description

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The rear A/F sensor transmits a signal to the powertrain control module (PCM). The PCM controls fuel injection duration by comparing the target air/fuel ratio with the rear A/F sensor signal. The sensor includes the VS cell, the pump cell, the atmospheric reference cavity, the diffusion layer, and the heater, and it enables overall feedback control.

If the IPB1 terminal voltage is a specified value or less, the PCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

ENABLE CONDITIONS CHART

2008 Acura MDX	
2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX	

Condition	
State of the engine	Running
No active DTCs	P0135, P2195, P2237, P2243, P2245, P2251, P2252, P2627, P2628

Malfunction Threshold

The IPB1 input terminal voltage is 1.0 V or less for at least 5 seconds*, 85 seconds**.

Driving Pattern

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle for 2 minutes.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2240 (156): ADVANCED DIAGNOSTICS

DTC P2240: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) IP CIRCUIT HIGH VOLTAGE

Fig. 310: Front Air/Fuel Ratio (A/F) Sensor (High Voltage) - Circuit Diagram

General Description

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) is installed in the exhaust manifold and detects oxygen content in the exhaust gas. The front A/F sensor transmits a signal to the powertrain control module (PCM). The PCM controls fuel injection duration by comparing the target air/fuel ratio with the front A/F sensor signal. The sensor includes the VS cell, the pump cell, the atmospheric reference cavity, the diffusion layer, and the heater, and it enables overall feedback control.

If the IPB2 terminal voltage is out of a specified range, the PCM detects a malfunction and stores a DTC.

DTC P2270 (161): ADVANCED DIAGNOSTICS

DTC P2270: REAR SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 1, SENSOR 2)) CIRCUIT SIGNAL STUCK LEAN

P2270-0570

Fig. 322: Rear Secondary Heated Oxygen Sensor Mixture Ratio Pattern

General Description

The rear secondary HO2S (bank 1, sensor 2) detects the oxygen concentration in the exhaust gas downstream of the three-way catalyst (TWC). The rear sensor output voltage characteristics are similar to the air/fuel ratio (A/F) sensor. The oxygen concentration is detected after the TWC during fuel feedback control using the A/F sensor, and it optimizes the fuel feedback control to maximize the effect of the TWC. If, after current is applied to the rear secondary HO2S heater, the rear secondary HO2S does not fluctuate and the output is stuck within the specified area, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Malfunction Threshold

The rear secondary HO2S (bank 1, sensor 2) output voltage is 0.650 V or less.

Driving Pattern

1. Start the engine. Let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 35 mph (57 km/h) or more for at least 36.3 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2271 (161): ADVANCED DIAGNOSTICS

DTC P2271: REAR SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 1, SENSOR 2)) CIRCUIT SIGNAL STUCK RICH

Fig. 323: Rear Secondary Heated Oxygen Sensor Mixture Ratio Pattern

General Description

The rear secondary HO2S (bank 1, sensor 2) detects the oxygen concentration in the exhaust gas downstream of the three-way catalyst (TWC). The rear sensor output voltage characteristics are similar to the air/fuel ratio (A/F) sensor. The oxygen concentration is detected after the TWC during fuel feedback control using the A/F sensor, and it optimizes the fuel feedback control to maximize the effect of the TWC. If, after current is applied to the rear secondary HO2S heater, the rear secondary HO2S does not fluctuate and the output is stuck within the specified area, a malfunction is detected and a DTC is stored.

Fuel trim	0.73	1.47
Fuel feedback	Closed loop	
No active DTCs	P0101, P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0117, P0118, P0133, P0134, P0135, P0137, P0138, P0141, P0171, P0172, P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0335, P0339, P0340, P0341, P0344, P0401, P0403, P0404, P0443, P0496, P0497, P0627, P1077, P1078, P1128, P1129, P1172, P145C, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2270, P2413, P2646, P2647, P2648, P2649, P2A00	

Malfunction Threshold

The rear secondary HO2S (bank 1, sensor 2) output voltage is 0.293 V or more.

Driving Pattern

1. Start the engine. Let it idle until the radiator fan comes on.
2. Drive the vehicle at a steady speed of 35 mph (57 km/h) or more for at least 36.3 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear

command or by disconnecting the battery.

DTC P2272 (162): ADVANCED DIAGNOSTICS

DTC P2272: FRONT SECONDARY HEATED OXYGEN SENSOR (SECONDARY HO2S (BANK 2, SENSOR 2)) CIRCUIT SIGNAL STUCK LEAN

P2270-0570

Fig. 324: Front Secondary Heated Oxygen Sensor Mixture Ratio Pattern

General Description

The front secondary HO2S (bank 2, sensor 2) detects the oxygen concentration in the exhaust gas downstream of the three-way catalyst (TWC). The front sensor output voltage characteristics are similar to the air/fuel ratio (A/F) sensor. The oxygen concentration is detected after the TWC during fuel feedback control using the A/F sensor, and it optimizes the fuel feedback control to maximize the effect of the TWC. If, after current is applied to the front secondary HO2S heater, the front secondary HO2S does not fluctuate and the output is stuck within the specified area, a malfunction is detected and a DTC is stored.

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If

the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2279 (109): ADVANCED DIAGNOSTICS

DTC P2279: INTAKE AIR SYSTEM LEAK

P2279-0771

Fig. 326: Intake Air System - System Diagram

P1505-0272

Fig. 327: Intake Air System Throttle Position Graph**General Description**

The positive crankcase ventilation (PCV) system reduces hydrocarbons (HC). The PCV system recirculates unburned air/fuel mixture (blow-by vapor) into the intake manifold so that it is drawn into the engine and burned, thus reducing HC. If the PCV hose comes off while air is supplied mainly via the idle control system with the throttle closed, the amount of air supplied to the engine is considerably more than the amount of air the idle control system supplies.

The powertrain control module (PCM) estimates the amount of air supplied to the engine while the throttle valve is fully closed, and if the estimated amount is more than the upper limit, it detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Other	At idle	

Malfunction Threshold

Either of these conditions is met.

- The estimated volume of intake air is 310 l/min (327.6 US qt/min, 272.8 lmp qt/min) or more when the MAP value is 35 kPa (10.3 in.Hg, 260 mmHg).
- The estimated volume of intake air is 302 l/min (319.2 US qt/min, 265.8 lmp qt/min) or more when the MAP value is 62 kPa (18.2 in.Hg, 460 mmHg).

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Let the engine idle for at least 22 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2413 (12): ADVANCED DIAGNOSTICS

DTC P2413: EXHAUST GAS RECIRCULATION (EGR) SYSTEM MALFUNCTION

Malfunction Determination

P2413-0370

Fig. 328: Exhaust Gas Recirculation Malfunction Determination Graph**General Description**

The exhaust gas recirculation (EGR) valve, which is controlled by the powertrain control module (PCM), is opened and the exhaust gas flows from the exhaust manifold through the EGR valve and the intake manifold and the EGR passage. The exhaust gas is circulated into the air/fuel mixture and the mixture is drawn into the combustion chamber to lower the combustion temperatures, thus reducing oxides of nitrogen (NOx) emissions.

A sensor (lift sensor) is built into the EGR valve and detects the amount of valve lift. The command value for the target valve lift is stored in the PCM so that exhaust gas recirculation can be optimized according to driving conditions.

Comparing this command value with the lift sensor output signal value, the PCM controls the EGR valve to make the amount of actual valve lift equal to the command value.

If the valve sensor output is insufficient for the commanded valve lift, a malfunction is detected.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Once per driving cycle

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2422 (117): ADVANCED DIAGNOSTICS

DTC P2422: EVAPORATIVE EMISSION (EVAP) CANISTER VENT SHUT VALVE CLOSE MALFUNCTION

P2422-0373

Fig. 329: Evaporative Emission (EVAP) Canister Vent Shut Valve Purge Flow

Malfunction Judgment Flowchart of FTP Sensor and EVAP Canister Vent Shut Valve

P1454-0371

Fig. 330: Malfunction Judgment Flow Chart FTP Sensor And EVAP Canister Vent Shut Valve

General Description

The fuel tank pressure (FTP) sensor output indicates about atmospheric pressure 0 kPa (0 in.Hg, 0 mmHg) before purge starts since the evaporative emission (EVAP) canister vent shut valve is normally open (open to the atmosphere). The sensor indicates a negative pressure value (vacuum) during purging.

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

When the FTP sensor indicates vacuum after starting the engine, there is the possibility of an FTP sensor zero point shift failure or an EVAP canister vent shut valve stuck closed failure. So the powertrain control module (PCM) monitors the FTP sensor output after purge starts. The PCM detects a malfunction of the EVAP canister vent shut valve if the output indicates excessive vacuum.

However, if the fuel tank internal pressure is below the specified value (excessive vacuum is detected) when starting the engine, the malfunction detection should be done as follows because it is difficult to distinguish the FTP sensor range problem (P1454) from the EVAP canister vent shut valve stuck closed (P2422).

1. If neither Temporary DTC (P1454 nor P2422) is stored, both DTCs are stored.
2. If both Temporary DTCs (P1454 and P2422) are stored and excessive vacuum is detected, both DTCs are stored.
3. If either Temporary DTC (P1454 or P2422) is stored and excessive vacuum is detected, the PCM stores the DTC of the Temporary DTC that was stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

Malfunction Threshold

The output from the fuel tank pressure sensor is -4 kPa (-1.0 in.Hg, -25 mmHg)*, -2 kPa (-0.4 in.Hg, -10 mmHg)** or less for at least 1.04*, 8** seconds.

*: Elapsed time after the FTP sensor output exceeds the malfunction threshold.

**: Excessive negative pressure is detected.

Confirmation Procedure with the HDS

Do the EVAP CVS ON in the INSPECTION MENU with the HDS.

Driving Pattern

Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on, then let it idle.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2610 (132): ADVANCED DIAGNOSTICS

DTC P2610: POWERTRAIN CONTROL MODULE (PCM) INTERNAL POWER OFF TIMER MALFUNCTION

P2810-0871

Fig. 331: Powertrain Control Module (PCM) - Communication Diagram**General Description**

The powertrain control module (PCM) has a built-in ignition off timer that measures the time the ignition switch is off. This measurement is used for evaporative emission (EVAP) leak detection and temperature assumption of the catalytic converter. The CPU in the PCM accesses the ignition off timer when reading the measured time. When the access process fails, a malfunction is detected and a DTC is stored. When an abnormality is found in the read data, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	N/A

Enable Conditions**ENABLE CONDITIONS CHART**

Condition	
Ignition switch	ON ⁽¹⁾
(1) Ignition switch on when a battery is disconnected and connected again is excluded.	

Malfunction Threshold

The access process to the ignition off timer fails, or a malfunction is found in the read data for at least 10 seconds.

Diagnosis Details**Conditions for illuminating the MIL**

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2646 (22): ADVANCED DIAGNOSTICS

DTC P2646: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT LOW VOLTAGE

P2646-0771

Fig. 332: Low And High VTEC Oil Pressure Switch - Flow Diagram

ROCKER ARM OIL PRESSURE SWITCH CHART

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

General Description

The VTEC system activates the rocker arm oil control solenoid by command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit that is determined by the PCM command and the oil pressure condition that is determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

Gear position	Other than P or N position	
No active DTCs	P2648, P2649	

Malfunction Threshold

When the rocker arm oil control solenoid is ON, the rocker arm oil pressure switch remains ON.

Confirmation Procedure with the HDS

Do the VTEC TEST in the INSPECTION MENU with the HDS.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle in a lower gear at 4,300 rpm or more for at least 7 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2647 (22): ADVANCED DIAGNOSTICS

DTC P2647: ROCKER ARM OIL PRESSURE SWITCH CIRCUIT HIGH VOLTAGE

P2646-0771

Fig. 333: Low And High VTEC Oil Pressure Switch - Flow Diagram

ROCKER ARM OIL PRESSURE SWITCH CHART

Logic Decision	Rocker Arm Oil Pressure Switch	
	'ON'	'OFF'
Rocker Arm Oil Control Solenoid Command 'ON'	Failure	Normal
Rocker Arm Oil Control Solenoid Command 'OFF'	Normal	Failure

General Description

The VTEC system activates the rocker arm oil control solenoid by command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between Low and High. The PCM monitors oil pressure in the hydraulic circuit of the VTEC mechanism using the rocker arm oil pressure switch downstream of the rocker arm oil control solenoid. If there is a difference between the oil pressure condition in the hydraulic circuit that is determined by the PCM command and the oil pressure condition that is determined by the status of the rocker arm oil pressure switch, the system is considered faulty, and a DTC is stored.

DTC P2648: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT LOW VOLTAGE

P2648-0700

Fig. 334: Rocker Arm Oil Control Solenoid (Low Voltage) - Circuit Diagram**General Description**

The VTEC system activates the rocker arm oil control solenoid by command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is OFF (low) when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid 1, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status**MONITOR DESCRIPTION CHART**

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions**ENABLE CONDITIONS CHART**

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
No active DTCs	P2649	

Malfunction Threshold

The return signal is OFF (low) for at least 2 seconds when the PCM outputs the ON (high) signal to the rocker arm oil control solenoid.

Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle in a lower gear at 4,400 rpm or more, for at least 7 seconds.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2649 (21): ADVANCED DIAGNOSTICS

DTC P2649: ROCKER ARM OIL CONTROL SOLENOID CIRCUIT HIGH VOLTAGE

P2648-0700

Fig. 335: Rocker Arm Oil Control Solenoid (High Voltage) - Circuit Diagram

General Description

The VTEC system activates the rocker arm oil control solenoid by command from the powertrain control module (PCM), and it charges/discharges the hydraulic circuit of the VTEC mechanism that switches valve timing between low and high. If the return signal is ON (high) when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid, the PCM detects a malfunction and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL ON
OBD Status	PASSED/FAILED/NOT COMPLETED (STILL TESTING)

Enable Conditions

ENABLE CONDITIONS CHART

Condition	Minimum	Maximum
Battery voltage	10.0 V	-
State of the engine	Running	
No active DTCs	P2648	

Malfunction Threshold

The return signal is ON (high) for at least 2 seconds when the PCM outputs the OFF (low) signal to the rocker arm oil control solenoid.

Driving Pattern

Start the engine, and let it idle for at least 7 seconds.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected, the MIL comes on and the DTC and the freeze frame data are stored in the PCM memory.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2A00 (157): ADVANCED DIAGNOSTICS

DTC P2A00: REAR AIR/FUEL RATIO (A/F) SENSOR (BANK 1, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM

2008 Acura MDX

2008 ENGINE PERFORMANCE Advanced Diagnostics - MDX

P1164-9871

Fig. 336: Rear Air/Fuel Ratio (A/F) Sensor Voltage Graph

General Description

The rear air/fuel ratio (A/F) sensor (bank 1, sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the rear A/F sensor output voltage and uses the fuel feedback control to improve exhaust emissions. The PCM monitors the rear A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

* Output to the scan tool exhibits a relationship between the rear A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage as the stoichiometric ratio is 0.

Monitor Execution, Sequence, Duration, DTC Type, OBD Status

MONITOR DESCRIPTION CHART

Execution	Once per driving cycle
Sequence	None
Duration	5.3 seconds or more
DTC Type	Two drive cycles, MIL ON
OBD Status	PASSED/FAILED/EXECUTING/OUT OF (TEST) CONDITION

Malfunction Threshold

The rear A/F sensor (bank 1, sensor 1) output voltage is 2.55 V or less, or 4.50 V or more.

Driving Pattern

P2A00-0550

Fig. 337: Identifying Driving Pattern

1. Start the engine. Hold the engine speed at 3,000 rpm without load (in Park or neutral) until the radiator fan comes on.
2. Drive the vehicle at a speed between 25 - 55 mph (40 - 88 km/h) for at least 5 minutes.
3. Then, drive immediately at a steady speed between 55 - 75 mph (88 - 120 km/h) for at least 10 seconds.
4. Decelerate with the throttle valve fully closed for at least 6 seconds.
 - If the EVAP monitor runs instead of the HO2S monitor, turn the engine off, then restart it, and the HO2S monitor will restart.
 - Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

Diagnosis Details

Conditions for illuminating the MIL

When a malfunction is detected during the first drive cycle, a Temporary DTC is stored in the PCM memory. If

the malfunction recurs during the next (second) drive cycle, the MIL comes on and the DTC and the freeze frame data are stored.

Conditions for clearing the MIL

The MIL will be cleared if the malfunction does not recur during three consecutive trips in which the diagnostic runs.

The MIL, the DTC, the Temporary DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

DTC P2A03 (158): ADVANCED DIAGNOSTICS

DTC P2A03: FRONT AIR/FUEL RATIO (A/F) SENSOR (BANK 2, SENSOR 1) CIRCUIT RANGE/PERFORMANCE PROBLEM

P1164-9871

Fig. 338: Front Air/Fuel Ratio (A/F) Sensor Voltage Graph

General Description

The front air/fuel ratio (A/F) sensor (bank 2, sensor 1) has a linear signal output in relation to the oxygen concentration. The powertrain control module (PCM) computes the air/fuel ratio from the front A/F sensor output voltage and uses the fuel feedback control to improve exhaust emissions. The PCM monitors the front A/F sensor output voltage during deceleration with the throttle fully closed, and if the output voltage deviates greatly from normal oxygen concentration levels, it detects a malfunction and stores a DTC.

* Output to the scan tool exhibits a relationship between the front A/F sensor output and oxygen concentration, which is opposite to the characteristic shown in the graph. That is, a deviation toward the rich side increases the output voltage and one toward the lean side decreases the output voltage as the stoichiometric ratio is 0.

The MIL, the DTC, and the freeze frame data can be cleared by using the scan tool Clear command or by disconnecting the battery.

2007-09 RESTRAINTS

SRS (Supplemental Restraint System) - MDX

COMPONENT LOCATION INDEX

Fig. 1: SRS Component Location Index (1 Of 2)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

Fig. 2: SRS Component Location Index (2 Of 2)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

PRECAUTIONS AND PROCEDURES

GENERAL PRECAUTIONS

Please read the following precautions carefully before servicing the airbag system. Observe the instructions described in this manual, or the airbags could accidentally deploy and cause damage or injuries.

- Except when doing electrical inspections, always turn the ignition switch to LOCK (0), do the battery terminal disconnection procedure(see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION** , then wait for 3 minutes before starting work.

NOTE: **The SRS memory is not erased even if the ignition switch is turned to LOCK (0) or the battery cables are disconnected from the battery.**

- Use replacement parts which are manufactured to the same standards and quality as the original parts. Do not install used SRS parts. Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it. Do not install any part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.

Fig. 3: Precautions For SRS Parts Handling
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Before removing the SRS unit connectors, always disconnect the appropriate SRS parts connectors.
- Use only a digital multimeter to check the system. If it is not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the lowest value in the ohmmeter range. A tester with a higher output could cause accidental deployment and possible injury.
- Do not put objects on the front passenger's airbag.
- The original audio system has a coded theft protection circuit. Make sure you have the anti-theft codes for the audio system and the navigation system (if equipped).

STEERING-RELATED PRECAUTIONS

Cable Reel Alignment

- Misalignment of the cable reel could cause an open in the wiring, making the SRS system, remote steering wheel controls, and the horn inoperative. Center the cable reel whenever the following is performed (see step 6).
 - Installation of the steering wheel
 - Installation of the cable reel
 - Installation of the steering column
 - Other steering-related adjustment or installation
- Do not disassemble the cable reel.
- Do not apply grease to the cable reel.
- If the cable reel shows any signs of damage, replace it with a new one. For example, if it does not rotate smoothly, replace the cable reel.

AIRBAG HANDLING AND STORAGE

Do not disassemble an airbag. It has no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.

For temporary storage of an airbag during service, observe the following precautions.

- Store the removed airbag with the pad surface up. Never put anything on the airbag.

Fig. 4: Precautions For Store Removed Airbag

Courtesy of AMERICAN HONDA MOTOR CO., INC.

- To prevent damage to the airbag, keep it away from any oil, grease, detergent, or water.

Fig. 5: Precautions For Airbag Damage - Keep It Away From Any Oil, Grease, Detergent, Or Water

Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Store the removed airbag on a secure, flat surface away from any high heat source (exceeding 200°F/ 93°C).

Fig. 6: Precautions For Store Removed Airbag On Secure, Flat Surface Away From Any High Heat Source (Exceeding 200°F/ 93°C)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Never do electrical tests on the airbags, such as measuring resistance.
- Do not position yourself in front of the airbag during removal, inspection, or replacement.

Fig. 7: Precautions For Airbag During Removal, Inspection, Or Replacement
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- For proper disposal of a damaged airbag, refer to airbag disposal (see **AIRBAG AND TENSIONER DISPOSAL**).
- The side curtain airbag inflator assembly is a long, jointed part containing an inflator (A), a flexible bag (B), and brackets (C).

Fig. 8: Identifying Side Curtain Airbag Inflator Assembly Is Long, Jointed Part Containing Inflator, Flexible Bag And Brackets
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- When removing or installing the side curtain airbag inflator assembly, never handle the flexible bag (B).

SRS UNIT, FRONT AND SIDE IMPACT SENSORS, DRIVER'S SEAT POSITION SENSOR, AND FRONT PASSENGER'S WEIGHT SENSORS

- Turn the ignition switch OFF, disconnect the negative cable from the battery, and wait at least 3 minutes before beginning installation or replacement of the SRS unit or disconnecting the connectors from the SRS unit.
- Be careful not to bump or impact the SRS unit, front impact sensors, or side impact sensors when the

ignition switch is ON (II), or for at least 3 minutes after the ignition switch is turned OFF.

- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRS unit, front impact sensors, or side impact sensors. The airbags could accidentally deploy and cause damage or injury.

Fig. 9: Precautions For During Installation Or Replacement
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- After a collision where a front airbag, side curtain airbags, or a seat belt tensioner deployed, go to **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**. After a collision where the airbags or the side airbags did not deploy, inspect for any damage or any deformation on the SRS unit, front impact sensors, rear safing sensor, and side impact sensors. Replace all damaged parts.

Fig. 10: Identifying For Any Damage Or Any Deformation On SRS Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Do not disassemble the SRS unit, front impact sensors, side impact sensors, driver's seat position sensor, and front passenger's weight sensors.
- Be sure the SRS unit, front impact sensors, and side impact sensors are installed securely with the mounting bolts torqued to 9.8 N.m (1.0 kgf.m, 7.2 lbf.ft).
- Do not spill water or oil on the SRS unit or the side impact sensors, and keep them away from dust.
- Store the SRS unit, front impact sensors and side impact sensors in a cool (less than 104°F/40°C) and dry (less than 80 % relative humidity, no moisture) area.

WIRING PRECAUTIONS

Some of the SRS wiring can be identified by special yellow outer covering, and the SRS connectors can be

identified by their yellow color. Observe the instructions.

- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage in SRS wiring, replace the harness.

Fig. 11: Precautions For SRS Wiring (Never Attempt To Modify, Splice, Or Repair SRS Wiring)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Be sure to install the harness wires so they do not get pinched or interfere with other parts.

Fig. 12: Precautions For SRS Wiring (Harness Wires So They Do Not Get Pinched Or Interfere With Other Parts)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Make sure all SRS ground locations are clean, and grounds are securely fastened for optimum metal-to-metal contact. Poor grounds can cause intermittent problems that are difficult to diagnose.
- Do not use any silicone based cleaners or lubricants on any SRS connectors or terminals.

PRECAUTIONS FOR ELECTRICAL INSPECTIONS

- When using electrical test equipment, insert the probe of the tester into the wire side of the connector. Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.

Fig. 13: Precautions For Using Electrical Test Equipment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Use a U-shaped probe. Do not insert the probe forcibly.

Fig. 14: Precautions For Use U-Shaped Probe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Use specified service connectors in troubleshooting. Using improper tools could cause an error in inspection due to poor metal-to-metal contact.

SPRING-LOADED LOCK CONNECTOR

Some SRS system connectors have a spring-loaded lock.

Front Airbag Connectors

Disconnecting

To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector. Then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector.

Fig. 15: Disconnecting Front Airbag Connectors

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To reconnect, hold the pawl-side connector, and press on the back of the sleeve-side connector in the direction shown. As the two connector halves are pressed together, the sleeve is pushed back by the pawl (C). Do not touch the sleeve.

Fig. 16: Connecting Front Airbag Connectors

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Airbag Connector

Disconnecting

To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector. Then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector half.

Fig. 17: Disconnecting Side Airbag Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

Hold both connector halves, and press them firmly together until the projection (C) of the sleeve-side connector clicks.

Fig. 18: Connecting Side Airbag Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS

Special Tools Required

SRS short canceller 070AZ-SAA0100

NOTE:

- To prevent damaging the connector cavity, insert the short canceller straight into the cavity from the terminal side.
- Before installing the short canceller, wash it with electrical contact clearer, then dry it with compressed air.
- Do not use the short canceller if it is damaged.
- Make sure to remove the short canceller before reconnection.

When SRS unit connectors A (28P) or B (28P) are disconnected, a short circuit is created in the connector by its own function to prevent an airbag deployment. The circuit may need to be open sometimes when diagnosis is done on the system. Insert the short canceller (No. 070AZ-SAA0100) in the specified cavities when it is necessary to keep the circuit open for diagnosis.

Fig. 19: Identifying SRS Unit Connectors A (28P) Or B (28P)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Terminal numbers are shown from the wire side of the female terminals. Insert the short canceller(s) into the cavities on the terminal side of the connector.

Fig. 20: Identifying SRS Unit Connectors A (28P) Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

Fig. 21: Identifying SRS Unit Connectors B (28P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SEATS WITH SIDE AIRBAGS

Seats with side airbags have a "SIDE AIRBAG" label on the seat-back.

Fig. 22: Identifying Side Airbag Label
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- When cleaning, use a damp cloth to clean the seat. Do not soak the seat with liquid. Do not spray steam on the seat.
- Do not repair a torn or frayed seat-back cover. Replace the seat-back cover.
- After a collision where the side airbag was deployed, replace the side airbag and seat frame with new parts. If the seat-back cushion is split, it must be replaced.
- Never put aftermarket accessories on the seat (covers, pads, seat heaters, lights, etc.).

DISCONNECTING SYSTEM CONNECTORS

Turn the ignition switch OFF disconnect the negative cable from the battery, then wait for 3 minutes before starting the following procedures.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

- Before disconnecting the cable reel 4P connector (1), disconnect the driver's airbag 4P connector (2).
- Before disconnecting SRS unit connector B from the SRS unit, disconnect both seat belt tensioner 4P connectors (3, 4).

Fig. 23: SRS Unit System Connectors Diagram

Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Disconnect the negative cable from the battery, then wait for 3 minutes.

Driver's Airbag

2. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) from the cable reel.

Fig. 24: Identifying Access Panel And Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Passenger's Airbag

3. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**), then disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Fig. 25: Identifying Front Passenger's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Airbag

4. Disconnect both side airbag 2P connectors (A) from the floor wire harness.

Fig. 26: Identifying Side Airbag 2P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Curtain Airbag

5. Remove the quarter pillar trim (see **QUARTER PILLAR TRIM**).
6. Disconnect both floor wire harness 2P connectors (A) from the side curtain airbags.

Fig. 27: Identifying Floor Wire Harness 2P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Seat Belt Tensioner

7. Remove the B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**), then disconnect both floor wire harness 4P connectors (A) from the seat belt tensioners.

Fig. 28: Identifying Floor Wire Harness 4P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SRS Unit

8. Remove the driver's center console trim (see step 5 **CENTER CONSOLE REMOVAL/INSTALLATION**), SRS unit connector A (28P), SRS unit connector B (28P), and SRS unit connector C (16P) from the SRS unit.

Fig. 29: Identifying SRS Unit Connector A (28P), SRS Unit Connector B (28P) And SRS Unit Connector C (16P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

DTC (DIAGNOSTIC TROUBLE CODES)

The self-diagnostic function of the SRS system allows it to locate the causes of system problems and then store

this information in memory. For easier troubleshooting, this data can be retrieved via a data link circuit.

- When you turn the ignition switch ON (II), the SRS indicator comes on. If it goes off after 6 seconds, the system is normal, and is not currently detecting any abnormality.
- If there is an abnormality, the system locates and defines the problem, stores this information in memory, and turns the SRS indicator on. The data remains in the memory even when the ignition switch is turned off or if the battery is disconnected.
- The data is stored in memory as a diagnostic trouble code (DTC).
- DTCs are either latching or resetting depending on the malfunction. With resetting DTCs, the SRS indicator goes off the next time the ignition switch is turned ON and the system is normal, but the DTC is still stored. With latching DTCs, the SRS indicator does not turn OFF until the malfunction is repaired and the DTC is cleared.
- When you connect the HDS to the 16P data link connector (DLC), you can retrieve a more detailed DTC in the Honda Systems "SRS" menu.
- After reading and recording the DTC, proceed with the troubleshooting procedure for that code.

Precautions

- Use only a digital multimeter to check the system. If it's not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the smallest value in the ohmmeter range. A tester with a higher output could damage the airbag circuit or cause accidental airbag deployment and possible injury.
- Whenever the ignition switch is ON (II), or has been turned OFF for less than 3 minutes, be careful not to bump the SRS unit; the airbags could accidentally deploy and cause damage or injuries.
- Before you remove the dashboard wire harness or floor wire harness, disconnect the driver's airbag connector, the front passenger's airbag connector, both side airbag connectors, both side curtain airbag connectors, and both seat belt tensioner connectors.
- Make sure the battery is fully charged. If the battery is dead or low, measuring values may not be correct.
- Do not touch a tester probe to the terminals in the SRS unit or harness connectors, and do not connect the SRS unit terminals or the sensor terminals with a jumper wire. Use only the backprobe set and the multimeter. Backprobe spring-loaded lock type connectors correctly.

READING THE DTC

1. Make sure the ignition switch is OFF.
2. Connect the HDS to the data link connector (DLC) (A).

Fig. 30: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Use the HDS to check for DTCs.
6. Read and record the DTC.
7. Turn the ignition switch OFF, then wait for 10 seconds.
8. Disconnect the HDS from the DLC.
9. Do the troubleshooting procedure for the DTC.

CLEAR THE DTC MEMORY WITH THE HDS

NOTE: **Make sure the battery is fully charged before you begin.**

1. Make sure the ignition switch is OFF.
2. Connect the HDS to the data link connector (DLC) (A).

Fig. 31: Identifying Data Link Connector**Courtesy of AMERICAN HONDA MOTOR CO., INC.**

3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. In the SRS MENU of the HDS, select SRS, then DTC to clear DTC(s).
6. Turn the ignition switch OFF, then wait for 10 seconds.
7. Disconnect the HDS from the DLC.

CLEAR THE DTC MEMORY USING MES CONNECTOR WITHOUT THE HDS**Special Tools Required**

SCS Service Connector 07PAZ-001010A

NOTE: **Make sure the battery is fully charged before you begin.**

To clear the DTC(s) from the SRS unit, use the HDS or the following procedure.

1. Make sure the ignition switch is OFF.
2. Connect the SCS service connector (A) to the yellow MES 2P connector (B). Do not use a jumper wire.

**Fig. 32: Identifying SCS Service Connector And Yellow MES 2P Connector****Courtesy of AMERICAN HONDA MOTOR CO., INC.**

3. Turn the ignition switch ON (II).
4. The SRS indicator will come on for about 6 seconds, and then go off. Remove the SCS service connector from the MES connector (2P) within 4 seconds after the indicator goes off.
5. The SRS indicator will come on again. Reconnect the SCS service connector to the MES connector (2P) within 4 seconds after the indicator comes on.
6. When the SRS indicator goes off, remove the SCS service connector from the MES connector (2P) within 4 seconds.
7. The SRS indicator blinks two times, indicating that the memory has been cleared.

8. Turn the ignition switch OFF, then wait for 10 seconds.
9. Turn the ignition switch ON (II) again. If the SRS indicator comes on for 6 seconds, and then goes off, the system is OK.

TROUBLESHOOTING INTERMITTENT FAILURES

If there was a malfunction that sets a DTC, but it does not recur, it will be stored in the memory as an intermittent failure, and the SRS indicator may come on depending on the malfunction detected.

NOTE:

- Check the condition of the battery (see **BATTERY TEST**), and the charging system (see **ALTERNATOR AND REGULATOR CIRCUIT TROUBLESHOOTING**). Low battery voltage may cause some intermittent failures.
- A faulty cable reel can cause intermittent connections related to the driver's airbag inflator DTCs.
- Check all of the connections in the circuit for the DTC you are troubleshooting.

After checking the DTC, troubleshoot as follows:

1. Read the DTC (see "**READING THE DTC**").
2. Clear the DTC memory (see "**CLEAR THE DTC**").
3. Set the parking brake, then start the engine, and let it idle.
4. The SRS indicator comes on for about 6 seconds and then goes off.
5. Shake the related wire harnesses then the connectors, then look for loose connections and poor grounds.
6. Take a test-drive (quick acceleration, quick braking, and cornering), turn the steering wheel fully left and right, and hold it there for 5 to 10 seconds. If the problem recurs, the SRS indicator will come on.
7. If you cannot duplicate the concern, ask the client about the conditions when it occurred, or ask the client to demonstrate the concern.
8. If you cannot duplicate the intermittent failure, the system is OK at this time.

CHECKING FRONT PASSENGER'S WEIGHT SENSORS AFTER A VEHICLE COLLISION

1. Position the front passenger's seat to the rearmost position, adjust the seat-back to the forward most position. Do not move it from this position.
2. Drive the vehicle, accelerate to 20 mph (36 km/h), then stop on level ground.
3. Make sure the ignition switch is OFF.
4. Connect the HDS to the data link connector (DLC) (A).

Fig. 33: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the ignition switch ON (II).
6. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
7. From the SRS inspection menu, select Seat Weight Sensor, then Misc test, then "SEAT OUTPUT CHK" and follow the prompts until the front passenger's weight sensor operation check is completed.

ODS UNIT INITIALIZATION

When a seat-back cover, seat-back cushion, and/or ODS unit is replaced, initialize the ODS by doing this procedure.

NOTE: **A new (uninitialized) ODS unit installed with a faulty OPDS sensor can cause DTC 85-71.**

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Make sure the front passenger's seat is dry. Set the seat-back in a normal position, and make sure there is nothing on the seat.
3. Make sure the ignition switch is OFF and the MES connector is not shorted.
4. Connect the HDS to the data link connector (DLC) (A).

Fig. 34: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the ignition switch ON (II).
6. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
7. From the HDS Main Menu, select SRS, then SRS, then Calibration. In the Calibration Menu, select ODS INITIALIZATION. Follow the screen prompts to initialize the ODS unit.
8. Turn the ignition switch OFF.
9. Disconnect the HDS from the DLC.

NOTE: If the ODS system fails to initialize after several attempts, replace the OPDS sensor/seat-back and retry. If the ODS system continues to fail to initialize, replace the ODS unit (see **ODS UNIT REPLACEMENT**).

ODS UNIT CALIBRATION

When you replace the SRS unit, front passenger's weight sensors, or the ODS unit, calibrate the ODS unit.

While calibrating the ODS unit, observe these precautions:

- Make sure all components of the front passenger's seat are correctly installed.
- Make sure nothing is on or under the front passenger's seat.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Keep all the windows closed.
- Do all calibration procedures, except test-driving, in the service bay.
- Make sure the vehicle is on level ground.
- Keep the A/C and the heater off.
- Do not touch the front passenger's seat until you are prompted to or when you have completed the calibration.

- Do not expose the front passenger's seat to sudden temperature changes.
1. Position the front passenger's seat to the rearmost position, and adjust the seat-back to the forward most position. Do not move the seat from this position.
 2. Connect the HDS to the data link connector (DLC) (A).

Fig. 35: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Drive the vehicle, and accelerate to 20 mph (36 km/h), then stop on level ground.
5. From the Main Menu, select SRS, then Calibration, then Misc Test, then select "SWS INITIALIZATION," and follow the prompts until the calibration has been completed.

ODS UNIT OPERATION CHECK

- Replacement of front passenger's seat component(s) (except ODS unit and/or weight sensors)
- After a vehicle collision
- SRS unit replacement

PRE-OPERATION CHECK SET-UP

- Make sure all the components of the front passenger's seat are correctly installed.
- Position the front passenger's seat to the rearmost position. Adjust the seat-back to the forward most position. Do not move the seat from this position.
- Make sure nothing is on or under the front passenger's seat.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Keep the windows closed.
- Do all calibration procedures, except test-driving, in the service bay.

- Make sure the vehicle is on level ground.
- Turn the heater and the A/C off.
- Do not touch the passenger's seat during the calibration.
- Do not expose the front passenger's seat to sudden temperature changes.
- Make sure all aftermarket devices such as amplifiers, fluorescent light, air purifiers, CB or HAM radios, etc. are turned off.

AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S)

1. Connect the HDS to the data link connector (DLC) (A).

Fig. 36: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Drive the vehicle, accelerate to 20 mph (36 km/h), then stop on level ground.
4. From the HDS Main Menu, select SRS, then Inspection. In the HDS Inspection Menu, select "SEAT OUTPUT CHK" and follow the prompts until the ODS operation check has been completed.

DRIVER'S SEAT POSITION SENSOR OPERATION CHECK

Check the driver's seat position after any of these actions.

- Driver's seat position sensor replacement
 - Cover plate (front side of driver's seat slide rail) replacement
1. Make sure the driver's seat is at its full forward position.
 2. Make sure the ignition switch is OFF (0).
 3. Connect the HDS to the data link connector (DLC) (A).

Fig. 37: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch ON (II).
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
6. From the HDS Main Menu, select SRS, then Parameter Information, then Buckle Switch, Seat Position Sensor.
7. Using a piece of tape (A), mark the location on the seat's outer cover (B) where the front riser cover meets the seat riser (C). The driver's seat position sensor should read "NEAR."

Fig. 38: Identifying Location On Seat's Outer Cover Where Front Riser Cover Meets Seat Riser

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Move the seat back in small increments (about 0.2 in., 5 mm) until the driver's seat position sensor reads "NOT NEAR." The seat should be about 1 in. (25 mm) from the front.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

NOTE: It takes a few seconds for the HDS to display changes, so wait for about 5 seconds between each move.

If the driver's seat position sensor data does not work as described above, check the driver's seat position sensor or the cover plate for damage, and replace parts as needed.

9. Turn the ignition switch OFF, and disconnect the HDS from the DLC.

NOTE:

The "x" at the end of each DTC denotes a numeric character (0 thru 9) or an alpha character (A thru F) that you will see on the HDS display. The character is unrelated to your troubleshooting; it designates the SRS unit manufacturer and other detail used for product analysis.

- (1) The SRS indicator turns on and stays on whenever the ignition switch is in the ON (II) position, or until the code is cleared.
- (2) The SRS indicator turns on when the DTC is set. The SRS indicator will not turn on after the ignition switch is cycled from ON (II) to OFF (0), but the DTC will be stored in the SRS unit.

SYMPTOM TROUBLESHOOTING INDEX

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
SRS indicator does not come on	Symptom Troubleshooting (see <u>SRS indicator does not come on</u>)	Communication with HDS
SRS indicator stays on, but no DTCs are stored	Symptom Troubleshooting (see <u>SRS indicator stays on, but no DTCs are stored</u>)	Charging system for under or overcharging

HDS does not communicate with the SRS unit or the vehicle	Troubleshoot the DLC circuit (see <u>DLC CIRCUIT TROUBLESHOOTING</u>)	Communication with HDS

SYSTEM DESCRIPTION

SRS COMPONENTS

Airbags

The SRS is a safety device which, when used with the seat belt, is designed to help protect the driver and front passenger in a frontal impact exceeding a certain set limit. The system consists of the SRS unit, including safing sensor and impact sensor (A), the cable reel (B), the driver's airbag (C), the front passenger's airbag (D), side airbags (E), side curtain airbags (F), seat belt tensioners (G), side impact sensors (first) (H), front impact sensors (I), roll rate sensor (J), rear safing sensor (K) and side impact sensors (second) (L). Since the driver's and front passenger's airbags use the same sensors, both normally inflate at the same time. However, it is possible for only one airbag to inflate. This can occur when the severity of a collision is at the margin, or threshold, that the SRS unit determines whether or not the airbags will deploy. In such cases, the seat belt will provide sufficient protection, and the supplemental protection offered by the airbag would be minimal.

Front Passenger's Weight Sensors

The ODS unit (M) is in the front passenger's seat-back along with the weight sensors (N). The weight sensors detect the weight on the seat, and send the information to the ODS unit. If the total weight is about 65 lbs (30 kg) or less, the ODS unit sends a signal to the SRS unit to prevent the passenger's airbag from deploying. When the passenger's airbag is disabled, the passenger airbag cutoff indicator on the center panel comes on to alert the driver that the front passenger's airbag will not deploy in a front-end collision.

Driver's Seat Position Sensor

The driver's seat position sensor (O) is under the driver's seat on the left side. When the driver's seat is moved to its full forward position, the deployment of the driver's airbag is moderated to decrease its force of impact during a front-end collision.

Fig. 39: Identifying SRS Components

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Roll Rate Sensor

The roll rate sensor is located under the second row seat. It detects the amount of roll of the vehicle and sends the information to the SRS unit. The SRS unit uses this information to determine if a vehicle rollover is imminent. If so, it deploys both side curtain airbags and the front seat belt tensioners.

Rear Safing Sensor

The rear safing sensor is located under the second row seat. The rear safing sensor performs the same basic function as the safing sensor in the SRS unit. It measures sideways G force, such as the force the vehicle would receive in a side collision in the rear, and sends that information to the SRS unit. The SRS unit uses that information, and the information from the second side impact sensors to determine the side that is impacted and the force. If the threshold is met, the SRS unit deploys the side airbag, the side curtain airbag and the seat belt tensioner on that side.

SIDE AIRBAG CUTOFF INDICATOR/ODS OPERATION

The indicator comes on if the front passenger's seat is occupied by a small adult or child who is leaning into the deployment path, or an object (grocery bag, briefcase, purse, etc.) is in the seat. This indicates the passenger's side airbag is off and will not deploy; there is no problem with the side airbag. If the passenger sits upright or moves to another seat, or you remove the object from the seat, the light should go off. There will be some delay between the occupant's repositioning and when the indicator will turn on or off.

PASSENGER AIRBAG CUTOFF INDICATOR

The indicator comes on if the weight of the front passenger is about 65 lbs (30 kg) or less. This indicates the passenger's front airbag is off and will not deploy. The front airbag is shut off to reduce the chance of airbag-caused injuries.

SRS OPERATION

The main circuit in the SRS unit senses and judges the force of impact and, if necessary, ignites the inflator charges. If battery voltage is too low or power is disconnected due to the impact, the voltage regulator and the back-up power circuit will keep voltage at a constant level.

For the SRS to operate

Seat Belt Tensioners

1. A front impact sensor, side impact sensor or the rear safing sensor must activate and send electric signals to the microprocessor.
2. The microprocessor must compute the signals and send them to the tensioners.
3. The charges must ignite and deploy the tensioners.

Driver's and Front Passenger's Airbag(s)

1. A front impact sensor must activate and send electric signals to the microprocessor.
2. The microprocessor must compute the signals and send them to the airbag inflator(s).
3. The inflators that receives signals must ignite and deploy the airbags.

Side Airbag(s)

1. A side impact sensor must activate and send electric signals to the microprocessor.
2. The microprocessor must compute the signals and send them to the side airbag inflator(s). However, the microprocessor cuts off the signals to the front passenger's side airbag if the SRS unit determines that the front passenger's head is in the deployment path of the side airbag.
3. The inflator that receives the signal must ignite and deploy the side airbag.

Side Curtain Airbag(s)

1. Side impact sensor, roll rate sensor, or the rear safing sensor must activate, and send electrical signals to the microprocessor.
2. The microprocessor must compute the signals and send them to the side curtain airbag and side airbag inflator(s).
3. The inflator that receives the signals must ignite and deploy the side curtain airbag and side airbag at the same time.

**Fig. 40: SRS Operation Diagram**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Self-diagnostic System

A self-diagnostic circuit is built into the SRS unit; when the ignition switch is turned ON (II), the SRS indicator comes on and goes off after about 6 seconds if the system is operating normally.

If the indicator does not come on, or does not go off after 6 seconds, or if it comes on while driving, it indicates an abnormality in the system. The system must be inspected and repaired as soon as possible.

For better serviceability, the SRS unit memory stores a DTC that relates to the cause of the malfunction, and the unit is connected to the data link connector (DLC). This information can be read with the HDS when it is connected to the DLC (16P) (see **DTC (Diagnostic Trouble Codes)**).

NOTE: Before you disconnect the negative cable from the battery for troubleshooting, make sure you have the anti-theft codes for the audio system and the navigation system (if equipped).

DTC TROUBLESHOOTING

DTC 11-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-4X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN DRIVER'S AIRBAG SECOND INFLATOR; DTC 11-5X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the driver's airbag 4P connector (A) from the cable reel.

Fig. 48: Identifying Driver's Airbag 4P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the cable reel.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see GENERAL TROUBLESHOOTING INFORMATION).

Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.

Fig. 49: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
12. Reconnect the negative cable to the battery.
13. Clear the DTC memory.
14. Read the DTC.

Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

YES - Go to step 15.

NO - Open or increased resistance in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**).

15. Turn the ignition switch OFF. Disconnect the negative cable from the battery, and wait for 3 minutes.
16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8 on).
17. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
18. Measure the resistance between the terminals of both SRS simulator leads. There should be 1 Ω , or less.

Fig. 50: Identifying Resistance Between Terminals Of Both SRS Simulator Leads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified ?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.

DTC 11-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-6X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100
- SRS short canceller 070AZ-SAA0100

NOTE: Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** (see **PRECAUTIONS AND PROCEDURES**) and **General Troubleshooting Information** (see **GENERAL TROUBLESHOOTING INFORMATION**).and **Battery Terminal Disconnection and Reconnection** (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 11-3x or 11-6x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the driver's airbag 4P connector (A) from the cable reel.

Fig. 51: Identifying Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the cable reel.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 11-3x or 11-6x indicated?

YES - Go to step 9.

NO - Short in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, and wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.

Fig. 52: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
12. Reconnect the negative cable to the battery.
13. Clear the DTC memory.
14. Read the DTC.

Is DTC 11-3x or 11-6x indicated?

YES - Go to step 15.

NO - Short in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**).

15. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8 on).
17. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
18. Connect an SRS short canceller (070AZ-SAA0100) to No. 7 and No. 8 terminals and No. 1 and No. 2 terminals of SRS unit connector A (28P) (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
19. Measure the resistance between the terminals of both SRS simulator leads. There should be an open circuit or at least 1 M ohms.

Fig. 53: Identifying Resistance Between Terminals Of Both SRS Simulator Leads
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the dashboard wire harness; replace the dashboard wire harness.

DTC 11-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-AX (11-A0 TO 11-A9,11-AA TO 11-AF): SHORT TO POWER IN DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- RS simulator lead J 070AZ-SNAA100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 11-8x or 11-Ax indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the driver's airbag 4P connector (A) from the cable reel.

Fig. 54: Identifying Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the cable reel.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 11-8x or 11-Ax indicated?

YES - Go to step 9.

NO - Short to power in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.

Fig. 55: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
12. Reconnect the negative cable to the battery.
13. Clear the DTC memory.
14. Read the DTC.

Is DTC 11-8x or 11-Ax indicated?

YES - Go to step 15.

NO - Short to power in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**).

15. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8 on).
17. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
18. Reconnect the negative cable to the battery.
19. Turn the ignition switch ON (II).
20. Measure the for voltage between each terminal of the SRS simulator lead and body ground. There should be 0.5 V or less.

Fig. 56: Measuring For Voltage Between Each Terminal Of SRS Simulator Lead And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.

DTC 11-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-BX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 11-9x or 11-Bx indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the driver's airbag 4P connector (A) from the cable reel.

Fig. 57: Identifying Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the cable reel.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 11-9x or 11-Bx indicated?

YES - Go to step 9.

NO - Short to ground in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the dashboard wire harness 4P connector (A) from the cable reel.

Fig. 58: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
12. Reconnect the negative cable to the battery.
13. Clear the DTC memory.
14. Read the DTC.

Is DTC 11-9x or 11-Bx indicated?

YES - Go to step 15.

NO - Short to ground in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**).

15. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
16. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8 on).
17. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
18. Measure the resistance between each terminal of the SRS simulator lead and body ground. There should be an open circuit or at least 1Mohms.

Fig. 59: Identifying Resistance Between Each Terminal Of SRS Simulator Lead And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the dashboard wire harness; replace the dashboard wire harness.

DTC 12-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN OR INCREASED RESISTANCE IN FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-4X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN OR INCREASED RESISTANCE IN FRONT PASSENGER'S AIRBAG SECOND INFLATOR; DTC 12-5X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 12-1x, 12-2x, 12-4x, or 12-5x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Fig. 60: Identifying Front Passenger's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 0. connectors) and simulator lead J to the dashboard wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 12-1x, 12-2x, 12-4x, or 12-5x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8 on).
11. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
12. Measure the resistance between the terminals of both SRS simulator leads. There should be 1 ohms or less.

Fig. 61: Identifying Resistance Between Terminals Of Both SRS Simulator Leads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P). Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness.

DTC 12-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-6X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100
- SRS short canceller 070AZ-SAA0100

NOTE: Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** (see **PRECAUTIONS AND PROCEDURES**) and **General Troubleshooting Information** (see **GENERAL TROUBLESHOOTING INFORMATION**).and **Battery Terminal Disconnection and Reconnection** (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 12-3x or 12-6x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Fig. 62: Identifying Front Passenger's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 12-3x or 12-6x indicated?

YES - Go to step 9.

NO - Short in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8 on).
11. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
12. Connect an SRS short canceller (070AZ-SAA0100) to the No. 9 and No. 10 terminals, and the No. 3 and No. 4 terminals of SRS unit connector A (28P) (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
13. Measure the resistance between the terminals of both SRS simulator leads. There should be an open circuit or at least 1Mohms.

Fig. 63: Identifying Resistance Between Terminals Of Both SRS Simulator Leads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the dashboard wire harness; replace the dashboard wire harness.

DTC 12-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-AX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 12-8x or 12-Ax indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Fig. 64: Identifying Front Passenger's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 12-8x or 12-Ax indicated?

YES - Go to step 9.

NO - Short to power in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
11. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
12. Reconnect the negative cable to the battery.
13. Turn the ignition switch ON (II).
14. Measure the voltage between each terminal of the SRS simulator lead and body ground. There should be 0.5 V or less.

Fig. 65: Identifying Voltage Between Each Terminal Of SRS Simulator Lead And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.

DTC 12-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-BX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead J 070AZ-SNAA100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 12-9x or 12-Bx indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Fig. 66: Identifying Front Passenger's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead J to the dashboard wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 12-9x or 12-Bx indicated?

YES - Go to step 9.

NO - Short to ground in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
11. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the dashboard wire harness 4P connector.
12. Measure the resistance between each terminal of the SRS simulator lead and body ground. There should be an open circuit or at least 1 M ohms.

Fig. 67: Identifying Resistance Between Each Terminal Of SRS Simulator Lead And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the dashboard wire harness; replace the dashboard wire harness.

DTC 21-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN DRIVER'S SEAT BELT TENSIONER; DTC 21-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 21-1x or 21-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 4P connector (A) from the driver's seat belt tensioner.

Fig. 68: Identifying Floor Wire Harness 4P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 21-1x or 21-2x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Measure the resistance between the No. 1 and the No. 2 terminals of SRS unit connector B (28P). There should be 2.0-3.0 ohms.

Fig. 69: Identifying Resistance Between No. 1 And No. 2 Terminals Of SRS Unit Connector B (28P)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.

DTC 21-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 21-3x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.

4. Disconnect the floor wire harness 4P connector (A) from the driver's seat belt tensioner.

Fig. 70: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 21-3x indicated?

YES - Go to step 9.

NO - Short in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the simulator lead from the floor wire harness.
13. Measure the resistance between the No. 1 and the No. 2 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1Mohms.

Fig. 71: Identifying Resistance Between No. 1 And No. 2 Terminals Of SRS Unit Connector B (28P)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified ?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the floor wire harness; replace the floor wire harness.

DTC 21-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 21-8x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.

4. Disconnect the floor wire harness 4P connector (A) from the driver's seat belt tensioner.

Fig. 72: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 21-8x indicated?

YES - Go to step 9.

NO - Short to power in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the simulator lead from the floor wire harness.
13. Reconnect the negative cable to the battery.
14. Turn the ignition switch ON (II).
15. Measure the voltage between the No. 1 terminal of SRS unit connector B (28P) and body ground, and between the No. 2 terminal and body ground. There should be 0.5 V or less.

Fig. 73: Identifying Voltage Between No. 1 Terminal Of SRS Unit Connector B (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the floor wire harness; replace the floor wire harness.

DTC 21-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 21-9x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 4P connector (A) from the driver's seat belt tensioner.

Fig. 74: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 21-9x indicated?

YES - Go to step 9.

NO - Short to ground in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the front passenger's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the simulator lead from the floor wire harness.
13. Measure the resistance between the No. 1 terminal of SRS unit connector B (28P) and body ground, and between the No. 2 terminal and body ground. There should be an open circuit or at least 1 Mohms.

Fig. 75: Identifying Resistance Between No. 1 Terminal Of SRS Unit Connector B (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the floor wire harness; replace the floor wire harness.

DTC 22-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN FRONT PASSENGER'S SEAT BELT TENSIONER; DTC 22-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 22-1x or 22-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 4P connector (A) from the front passenger's seat belt tensioner.

Fig. 76: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 22-1x or 22-2x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Measure the resistance between the No. 3 and the No. 4 terminals of SRS unit connector B (28P). There should be 2.0-3.0 ohms.

Wire side of female terminals

Fig. 77: Identifying Resistance Between No. 3 And No. 4 Terminals Of SRS Unit Connector B (28P)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.

DTC 22-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 22-3x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.

4. Disconnect the floor wire harness 4P connector (A) from the front passenger's seat belt tensioner.

Fig. 78: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 22-3x indicated?

YES - Go to step 9.

NO - Short in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the simulator lead from the floor wire harness.
13. Measure the resistance between the No. 3 and the No. 4 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1M ohms.

Fig. 79: Identifying Resistance Between No. 3 And No. 4 Terminals Of SRS Unit Connector B (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the floor wire harness; replace the floor wire harness.

DTC 22-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 22-8x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.

4. Disconnect the floor wire harness 4P connector (A) from the front passenger's seat belt tensioner.

Fig. 80: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 22-8x indicated?

YES - Go to step 9.

NO - Short to power in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the simulator lead from the floor wire harness.
13. Reconnect the negative cable to the battery.
14. Turn the ignition switch ON (II).
15. Measure the voltage between the No. 3 terminal of SRS unit connector B (28P) and body ground, and between the No. 4 terminal and body ground. There should be 0.5 V or less.

Fig. 81: Identifying Voltage Between No. 3 Terminal Of SRS Unit Connector B (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the floor wire harness; replace the floor wire harness.

DTC 22-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead K 070AZ-SNAA200

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 22-9x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 4P connector (A) from the front passenger's seat belt tensioner.

Fig. 82: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead K to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 22-9x indicated?

YES - Go to step 9.

NO - Short to ground in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect the driver's seat belt tensioner 4P connector (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the simulator lead from the floor wire harness.
13. Measure the resistance between the No. 3 terminal of SRS unit connector B (28P) and body ground, and between the No. 4 terminal and body ground. There should be an open circuit or at least 1Mohms.

Fig. 83: Identifying Resistance Between No. 3 Terminal Of SRS Unit Connector B (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the floor wire harness; replace the floor wire harness.

DTC 31-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN DRIVER'S SIDE AIRBAG INFLATOR; DTC 31-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 31-1x or 31-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag (B).

Fig. 84: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 31-1x or 31-2x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be 1.0 ohms or less.

Fig. 85: Identifying Resistance Between Terminals Of Black SRS Simulator Lead (A)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.

DTC 31-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300
- SRS short canceller 070AZ-SAA0100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 31-3x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING**

INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag (B).

Fig. 86: Identifying Floor Wire Harness 2P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 31-3x indicated?

YES - Go to step 9.

NO - Short to another wire in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Connect the SRS short canceller (070AZ-SAA0100) to the No. 17 and No. 18 terminals of SRS unit connector B (28P) (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
14. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be an open circuit or at least 1 Mohms.

Fig. 87: Identifying Resistance Between Terminals Of Black SRS Simulator Lead (A)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the floor wire harness; replace the floor wire harness.

DTC 31-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 31-8x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag (B).

Fig. 88: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 31-8x indicated?

YES - Go to step 9.

NO - Short to power in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Reconnect the negative cable to the battery.
14. Turn the ignition switch ON (II).
15. Measure the voltage between each terminal of the black SRS simulator lead (A) and body ground. There should be 0.5 V or less.

Fig. 89: Identifying Voltage Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the floor wire harness; replace the floor wire harness.

DTC 31-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- RS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 31-9x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the driver's side airbag (B).

Fig. 90: Identifying Floor Wire Harness 2P Connector And Driver's Side Airbag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 31-9X indicated?

YES - Go to step 9.

NO - Short to ground in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between each terminal of the black SRS simulator lead (A) and body ground. There should be an open circuit or at least 1 Mohms.

Fig. 91: Identifying Resistance Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the floor wire harness; replace the floor wire harness.

DTC 32-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN FRONT PASSENGER'S SIDE AIRBAG INFLATOR; DTC 32-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 32-1x or 32-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag (B).

Fig. 92: Identifying Floor Wire Harness 2P Connector And Front Passenger's Side Airbag
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 32-1x or 32-2x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be 1.0 ohms or less.

Fig. 93: Identifying Resistance Between Terminals Of Black SRS Simulator Lead
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.

DTC 32-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300
- SRS short canceller 070AZ-SAA0100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 32-3x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING**

INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag (B).

Fig. 94: Identifying Floor Wire Harness 2P Connector And Front Passenger's Side Airbag
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 32-3x indicated?

YES - Go to step 9.

NO - Short to another wire in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Connect the SRS short canceller (070AZ-SAA0100) to the No. 19 and No. 20 terminals of SRS unit connector B (28P) (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
14. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be an open circuit or at least 1 Mohms.

Fig. 95: Identifying Resistance Between Terminals Of Black SRS Simulator Lead
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the floor wire harness; replace the floor wire harness.

DTC 32-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 32-8x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag (B).

Fig. 96: Identifying Floor Wire Harness 2P Connector And Front Passenger's Side Airbag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 32-8x indicated?

YES - Go to step 9.

NO - Short to power in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Reconnect the negative cable to the battery.
14. Turn the ignition switch ON (II).
15. Measure the voltage between each terminal of the black SRS simulator lead (A) and body ground. There should be 0.5 V or less.

Fig. 97: Identifying Voltage Between Each Terminal Of Black Srs Simulator Lead And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the floor wire harness; replace the floor wire harness.

DTC 32-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 32-9x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the floor wire harness 2P connector (A) from the front passenger's side airbag (B).

Fig. 98: Identifying Floor Wire Harness 2P Connector And Front Passenger's Side Airbag
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 32-9x indicated?

YES - Go to step 9.

NO - Short to ground in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between each terminal of the black SRS simulator lead (A) and body ground. There should be an open circuit or at least 1Mohms.

Fig. 99: Identifying Resistance Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the floor wire harness; replace the floor wire harness.

DTC 33-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN LEFT SIDE CURTAIN AIRBAG INFLATOR; DTC 33-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 33-1x or 33-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the left side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the left side curtain airbag connector (B).

Fig. 100: Identifying Floor Wire Harness 2P Connector And Left Side Curtain Airbag Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 0. connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 33-1x or 33-2x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the left side curtain airbag; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be 1.0 ohms or less.

Fig. 101: Identifying Resistance Between Terminals Of Black SRS Simulator Lead (A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at the SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.

DTC 33-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300
- SRS short canceller 070AZ-SAA0100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 33-3x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING**

INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the left side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the left side curtain airbag connector (B).

Fig. 102: Identifying Floor Wire Harness 2P Connector And Left Side Curtain Airbag Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 33-3x indicated?

YES - Go to step 9.

NO - Short to another wire in the left side curtain airbag inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Connect the SRS short canceller (070AZ-SAA0100) to the No. 21 and No. 22 terminals of SRS unit connector B (28P) (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
14. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be an open circuit or at least 1 Mohms.

Fig. 103: Identifying Resistance Between Terminals Of Black SRS Simulator Lead (A)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to another wire in the floor wire harness; replace the floor wire harness.

DTC 33-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 33-8x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the left side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the left side curtain airbag connector (B).

Fig. 104: Identifying Floor Wire Harness 2P Connector And Left Side Curtain Airbag Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 33-8x indicated?

YES - Go to step 9.

NO - Short to power in the left side curtain airbag inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect the SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Reconnect the negative cable to the battery.
14. Turn the ignition switch ON (II).
15. Measure the for voltage between each terminal of the black SRS simulator lead (A) and body ground. There should be 0.5 V or less.

Fig. 105: Identifying For Voltage Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the floor wire harness; replace the floor wire harness.

DTC 33-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 33-9x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the left side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the left side curtain airbag connector (B).

Fig. 106: Identifying Floor Wire Harness 2P Connector And Left Side Curtain Airbag Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 33-9x indicated?

YES - Go to step 9.

NO - Short to ground in the left side curtain airbag inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between each terminal of the black SRS simulator lead (A) and body ground. There should be an open circuit or at least 1 Mohms.

Fig. 107: Identifying Resistance Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the floor wire harness; replace the floor wire harness.

DTC 34-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN RIGHT SIDE CURTAIN AIRBAG INFLATOR; DTC 34-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**). Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 34-1x or 34-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the right side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the right side curtain airbag connector (B).

Fig. 108: Identifying Floor Wire Harness 2P Connector And Right Side Curtain Airbag Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 34-1x or 34-2x indicated?

YES - Go to step 9.

NO - Open or increased resistance in the right side curtain airbag inflator, replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be 1.0 ohms or less.

Fig. 109: Identifying Resistance Between Terminals Of Black SRS Simulator Lead
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open or increased resistance in the floor wire harness; replace the floor wire harness.

DTC 34-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300
- SRS short canceller 070AZ-SAA0100

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**). Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 34-3x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the right side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the right side curtain airbag connector (B).

Fig. 110: Identifying Floor Wire Harness 2P Connector And Right Side Curtain Airbag Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 34-3x indicated?

YES - Go to step 9.

NO - Short to another wire in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Connect the SRS short canceller (070AZ-SAA0100) to the No. 23 and No. 24 terminals of SRS unit connector B (28P) (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
14. Measure the resistance between the terminals of the black SRS simulator lead (A). There should be an open circuit or at least 1 Mohms.

Fig. 111: Identifying Resistance Between Terminals Of Black SRS Simulator Lead
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the floor wire harness; replace the floor wire harness.

DTC 34-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 34-8x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the right side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the right side curtain airbag connector (B).

Fig. 112: Identifying Floor Wire Harness 2P Connector And Right Side Curtain Airbag Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 34-8x indicated ?

YES - Go to step 9.

NO - Short to power in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch to LOCK(0). Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Reconnect the negative cable to the battery.
14. Turn the ignition switch ON (II).
15. Measure the voltage between each terminal of the black SRS simulator lead (A) and body ground. There should be 0.5 V or less.

Fig. 113: Identifying Voltage Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the floor wire harness; replace the floor wire harness.

DTC 34-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 34-9x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Remove the right side quarter pillar trim (see **QUARTER PILLAR TRIM**), then disconnect the floor wire harness 2P connector (A) from the right side curtain airbag connector (B).

Fig. 114: Identifying Floor Wire Harness 2P Connector And Right Side Curtain Airbag Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the SRS inflator simulator (2 ohms connectors) and simulator lead L to the floor wire harness.
6. Reconnect the negative cable to the battery.
7. Clear the DTC memory.
8. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 34-9x indicated?

YES - Go to step 9.

NO - Short to ground in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**).

9. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
10. Disconnect both seat belt tensioner 4P connectors (see step 7).
11. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
12. Disconnect the SRS inflator simulator from the SRS simulator lead. Do not disconnect the simulator lead from the floor wire harness 2P connector.
13. Measure the resistance between each terminal of the black SRS simulator lead (A) and body ground. There should be an open circuit or at least 1Mohms.

Fig. 115: Identifying Resistance Between Each Terminal Of Black SRS Simulator Lead (A) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (28P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the floor wire harness; replace the floor wire harness.

DTC 41-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE LEFT FRONT IMPACT SENSOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 41-1x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING**

INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF.
4. Disconnect the negative cable from the battery, and wait for 3 minutes.
5. Check the connections between SRS unit connector A (28P) and the SRS unit, between the left engine compartment wire harness 2P connector and the left front impact sensor (see **COMPONENT LOCATION INDEX**), and at connector C305 (see **LEFT ENGINE COMPARTMENT WIRE HARNESS**).

Are the connections OK?

YES - Go to step 6.

NO - Repair the poor connections and retest. If DTC 41-1x is still present, go to step 6.

6. Disconnect the left engine compartment wire harness 2P connector (A) from the left front impact sensor.

Fig. 116: Identifying Left Engine Compartment Wire Harness 2P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
8. Measure the resistance between the No. 15 and No. 27 terminals of SRS unit connector A (28P). There should be an open circuit or at least 1 M ohms.

SRS UNIT CONNECTOR A (28P)

Wire side of female terminals

Fig. 117: Identifying Resistance Between No. 15 And No. 27 Terminals Of SRS Unit Connector A (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9.

NO - Short in the left engine compartment wire harness or dashboard wire harness; replace the faulty harness.

9. Measure the resistance between the No. 15 terminal of SRS unit connector A (28P) and body ground, and between the No. 27 terminal and body ground. There should be an open circuit or at least 1 M ohms.

Fig. 118: Identifying Resistance Between No. 15 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to ground in the dashboard wire harness or the left engine compartment wire harness; replace the faulty harness.

10. Reconnect the negative cable to the battery.
11. Turn the ignition switch ON (II).
12. Measure the voltage between the No. 15 terminal of SRS unit connector A (28P) and body ground, and between the No. 27 terminal and body ground. There should be 0.5 V or less.

Fig. 119: Identifying Voltage Between No. 15 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 13.

NO - Short to power in the left engine compartment wire harness or the dashboard wire harness; replace the faulty harness.

13. Turn the ignition switch LOCK(0).
14. Connect the SRS inflator simulator (jumper connector) and the black lead (A) of simulator lead L to the left engine compartment wire harness 2P connector (B).

Fig. 120: Identifying Black Lead Of Simulator Lead L And Left Engine Compartment Wire Harness 2P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Measure the resistance between the No. 15 and No. 27 terminals of SRS unit connector A (28P). There should be 0-1.0 ohms.

SRS UNIT CONNECTOR A (28P)

Wire side of female terminals

Fig. 121: Identifying Resistance Between No. 15 And No. 27 Terminals Of SRS Unit Connector A (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty left front impact sensor or SRS unit; replace the left front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**). If the problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Poor connection at C305, open in left engine compartment wire harness, or open in dashboard wire harness. Inspect C305 (see **LEFT ENGINE COMPARTMENT WIRE HARNESS**). If it is OK, replace the faulty harness.

DTC 42-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE RIGHT FRONT IMPACT SENSOR

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 42-1x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF.
4. Disconnect the negative cable from the battery, then wait for 3 minutes.
5. Check the connections between SRS unit connector A (28P) and the SRS unit, between the right engine compartment wire harness 2P connector and the right front impact sensor (see **COMPONENT LOCATION INDEX**), and at connector C203 (see **RIGHT ENGINE COMPARTMENT WIRE HARNESS (DASH TO REAR OF ENGINE COMPARTMENT)**).

Are the connections OK?

YES - Go to step 6.

NO - Repair the poor connections and retest. If DTC 42-1x is still present, go to step 6.

6. Disconnect the right engine compartment wire harness 2P connector (A) from the right front impact sensor.

Fig. 122: Identifying Right Engine Compartment Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
8. Measure the resistance between the No. 16 and No. 28 terminals of SRS unit connector A (28P). There should be an open circuit or at least 1Mohms.

SRS UNIT CONNECTOR A (28P)

Wire side of female terminals

Fig. 123: Identifying Resistance Between No. 16 And No. 28 Terminals Of SRS Unit Connector A (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9.

NO - Short in the right engine compartment wire harness or dashboard wire harness; replace the faulty harness.

9. Measure the resistance between the No. 16 terminal of SRS unit connector A (28P) and body ground, and between the No. 28 terminal and body ground. There should be an open circuit or at least 1 Mohms.

SRS UNIT CONNECTOR A (28P)

Wire side of female terminals

Fig. 124: Identifying Resistance Between No. 16 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to ground in the dashboard wire harness or the right engine compartment wire harness; replace the faulty harness.

10. Reconnect the negative cable to the battery.

11. Turn the ignition switch ON (II).
12. Measure the voltage between the No. 16 terminal of SRS unit connector A (28P) and body ground, and between the No. 28 terminal and body ground. There should be 0.5 V or less.

Fig. 125: Identifying Voltage Between No. 16 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 13.

NO - Short to power in the right engine compartment wire harness or dashboard wire harness; replace the faulty harness.

13. Turn the ignition switch OFF.
14. Connect the SRS inflator simulator (jumper connector) and the black lead (A) of simulator lead L to the right engine compartment wire harness 2P connector (B).

Fig. 126: Identifying Black Lead Of Simulator Lead L And Right Engine Compartment Wire Harness 2P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Measure the resistance between the No. 16 and No. 28 terminals of SRS unit connector A (28P). There should be 0-1.0 ohms.

SRS UNIT CONNECTOR A (28P)

Wire side of female terminals

Fig. 127: Identifying Resistance Between No. 16 And No. 28 Terminals Of SRS Unit Connector A (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified ?

YES - Faulty right front impact sensor or SRS unit; replace the right front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**). If the problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Poor connection at C203, open in right engine compartment wire harness, or open in dashboard wire harness. Inspect C203 (see **RIGHT ENGINE COMPARTMENT WIRE HARNESS (DASH TO REAR OF ENGINE COMPARTMENT)**). If it is OK, replace the faulty harness.

DTC 41-2X, 41-8X, 41-9X, 41-AX, 41-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE LEFT FRONT IMPACT SENSOR; DTC 42-2X, 42-8X, 42-9X, 42-AX, 42-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE RIGHT FRONT IMPACT SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 41-2x, 41-8x, 41-9x, 41-Ax, 41-Bx, 42-2x, 42-8x, 42-9x, 42-Ax, or 42-Bx indicated?

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

YES - Replace the left or right front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**). If the DTC returns, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

DTC 43-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE LEFT SIDE IMPACT SENSOR (FIRST)); DTC 45-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE LEFT SIDE IMPACT SENSOR (SECOND)

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and wait for 10 seconds.
3. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 45-1x (except 45-11) indicated?

YES - Faulty left side impact sensor (second); replace the left side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).

NO - Go to step 4.

4. Read the DTC.

Is DTC 43-1x (except 43-11) indicated?

YES - Faulty left side impact sensor (first); replace the left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).

NO - Go to step 5.

5. Read the DTC.

Is DTC 43-11 indicated?

YES - Go to step 6.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

NO - Intermittent failure, the system is OK at this time.

6. Turn the ignition switch OFF.
7. Check for a damaged floor wire harness between SRS unit and left side impact sensor (first), left side impact sensor (first), and left side impact sensor (second).

Is the floor wire harness OK ?

YES - Go to step 8.

NO - Replace the floor wire harness.

8. Disconnect the negative cable from the battery, then wait for 3 minutes.
9. Replace the left side impact sensor (first) with a known-good part (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).
10. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
11. Turn the ignition switch ON (II), and wait for 10 seconds.
12. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 43-11 indicated?

YES - Go to step 13.

NO - Faulty left side impact sensor (first); replace the original left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).

13. Turn the ignition switch OFF.
14. Disconnect the negative cable from the battery, then wait for 3 minutes.
15. Replace the left side impact sensor (second) with a known-good part (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).
16. Clear the DTC (see **CLEAR THE DTC MEMORY WITH THE HDS**).
17. Turn the ignition switch ON (II), and wait for 10 seconds.
18. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 43-11 indicated?

YES - Go to step 19.

NO - Faulty left side impact sensor (second); replace the original left side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).

19. Turn the ignition switch to LOCK(0).
20. Disconnect the negative cable from the battery, then wait for 3 minutes.
21. Disconnect both seat belt tensioner 4P connectors (see step 7).

22. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
23. Disconnect the floor wire harness 2P connector (A) from the left side impact sensor (second) (see step 4).

Fig. 128: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Disconnect the floor wire harness 4P connector (A) from the left side impact sensor (first) (see step 5).

Fig. 129: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Measure the resistance between the No. 2 and No. 3 terminal of the floor wire harness 4P connector. There should be an open circuit or at least 1 M ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 130: Identifying Resistance Between No. 2 And No. 3 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 26.

NO - Short in the floor wire harness; replace the floor wire harness.

26. Measure the resistance between the No.1 and No. 4 terminal of the floor wire harness 4P connector. There should be an open circuit or at least 1Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 131: Identifying Resistance Between No.1 And No. 4 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 27.

NO - Short in the floor wire harness; replace the floor wire harness.

27. Measure the resistance between the No. 2 terminal of floor wire harness 4P connector and body ground, and between the No. 3 terminal and body ground. There should be an open circuit or at least 1 Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 132: Measuring Resistance Between No. 2 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 28.

NO - Short to ground in the floor wire harness; replace the floor wire harness.

28. Measure the resistance between the No. 1 terminal of floor wire harness 4P connector and body ground, and between the No. 4 terminal and body ground. There should be an open circuit or at least 1 Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 133: Identifying Resistance Between No. 1 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 29.

NO - Short to ground in the floor wire harness; replace the floor wire harness.

29. Reconnect the negative cable to the battery.
30. Turn the ignition switch ON (II).

31. Measure the voltage between the No. 2 terminal of floor wire harness 4P connector and body ground, and between the No.3 terminal and body ground. There should be less than 1 V.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 134: Identifying Voltage Between No. 2 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 32.

NO - Short to power in the floor wire harness; replace the floor wire harness.

32. Turn the ignition switch OFF.
33. Install a jumper wire between the No. 25 terminal and No. 26 terminal of the SRS unit connector B (28P).

SRS UNIT CONNECTOR B (28P)

Wire side of female terminals

Fig. 135: Identifying Jumper Wire Between No. 25 Terminal And No. 26 Terminal Of SRS Unit Connector B (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Measure the resistance between the No. 2 and No. 3 terminal of the floor wire harness 4P connector. There should be 0-10 Ω .

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 136: Identifying Resistance Between No. 2 And No. 3 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 35.

NO - Open in the floor wire harness; replace the floor wire harness.

35. Connect the SRS inflator simulator (jumper connector) and the black lead (A) of simulator lead L to the floor wire harness 2P connector (B).

Fig. 137: Identifying Black Lead Of Simulator Lead L And Floor Wire Harness 2P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Measure the resistance between the No. 1 and No. 4 terminal of the floor wire harness 4P connector. There should be less than 1.0 ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 138: Identifying Resistance Between No. 1 And No. 4 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Reconnect the floor wire harness 4P connector to the left side impact sensor (first) and left side impact sensor (second). If the DTCs are still indicated, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the floor wire harness; replace the floor wire harness.

DTC 44-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE RIGHT SIDE IMPACT SENSOR (FIRST); DTC 46-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE RIGHT SIDE IMPACT SENSOR (SECOND)

Special Tools Required

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and wait for 10 seconds.
3. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 46-1x (except 46-11) indicated?

YES - Faulty right side impact sensor (second); replace the right side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

NO - Go to step 4.

4. Read the DTC.

Is DTC 44-1x (except 44-11) indicated?

YES - Faulty right side impact sensor (first); replace the right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).

NO - Go to step 5.

5. Read the DTC.

Is DTC 44-11 indicated?

YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time.

6. Turn the ignition switch OFF.
7. Check for damage to the floor wire harness between the SRS unit and right side impact sensor (first), right side impact sensor (first), and right side impact sensor (second).

Is the floor wire harness OK?

YES - Go to step 8.

NO - Replace the floor wire harness.

8. Disconnect the negative cable from the battery, then wait for 3 minutes.
9. Replace the right side impact sensor (first) with a known-good part (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).
10. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
11. Turn the ignition switch ON (II), and wait for 10 seconds.
12. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 44-11 indicated?

YES - Go to step 13.

NO - Faulty right side impact sensor (first); replace the original right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).

13. Turn the ignition switch OFF.
14. Disconnect the negative cable from the battery, then wait for 3 minutes.

15. Replace the right side impact sensor (second) with a known-good part (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).
16. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
17. Turn the ignition switch ON (II), and wait for 10 seconds.
18. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 44-11 indicated?

YES - Go to step 19.

NO - Faulty right side impact sensor (second); replace the original right side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).

19. Turn the ignition switch to LOCK(0).
20. Disconnect the negative cable from the battery, then wait for 3 minutes.
21. Disconnect both seat belt tensioner 4P connectors (see step 7).
22. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
23. Disconnect the floor wire harness 2P connector (A) from the right side impact sensor (second) (see step 4).

Fig. 139: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Disconnect the floor wire harness 4P connector (A) from the right side impact sensor (first) (see step 5).

Fig. 140: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Measure the resistance between the No. 2 and No. 3 terminal of the floor wire harness 4P connector. There should be an open circuit or at least 1 Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 141: Identifying Resistance Between No. 2 And No. 3 Terminal Of Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 26.

NO - Short in the floor wire harness; replace the floor wire harness.

26. Measure the resistance between the No.1 and No. 4 terminal of the right side wire harness 4P connector. There should be an open circuit or at least 1Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 142: Identifying Resistance Between No.1 And No. 4 Terminal Of Right Side Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 27.

NO - Short in the floor wire harness; replace the floor wire harness.

27. Measure the resistance between the No. 2 terminal of floor wire harness 4P connector and body ground, and between the No. 3 terminal and body ground. There should be an open circuit or at least 1Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 143: Identifying Resistance Between No. 2 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 28.

NO - Short to ground in the floor wire harness; replace the floor wire harness.

28. Measure the resistance between the No. 1 terminal of floor wire harness 4P connector and body ground, and between the No. 4 terminal and body ground. There should be an open circuit or at least 1 Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 144: Identifying Resistance Between No. 1 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 29.

NO - Short to ground in the floor wire harness; replace the floor wire harness.

29. Reconnect the negative cable to the battery.
30. Turn the ignition switch to ON (II).
31. Measure the voltage between the No. 2 terminal of floor wire harness 4P connector and body ground, and between the No. 3 terminal and body ground. There should be less than 0.5 V.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 145: Identifying Voltage Between No. 2 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 32.

NO - Short to power in the floor wire harness; replace the floor wire harness.

32. Turn the ignition switch OFF.
33. Install a jumper wire between the No. 27 terminal and No. 28 terminal of the SRS unit connector B (28P).

Wire side of female terminals

Fig. 146: Identifying Jumper Wire Between No. 27 Terminal And No. 28 Terminal Of SRS Unit Connector B (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Measure the resistance between the No. 2 and No. 3 terminal of the floor wire harness 4P connector. There should be less than 1.0 ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 147: Identifying Resistance Between No. 2 And No. 3 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 35.

NO - Open in the floor wire harness; replace the floor wire harness.

35. Connect the SRS inflator simulator (jumper connector) and the black lead (A) of simulator lead L to the floor wire harness 2P connector (B).

Fig. 148: Identifying Black Lead Of Simulator Lead L And Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Measure the resistance between the No. 1 and No. 4 terminal of the floor wire harness 4P connector. There should be 0-1.0 ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 149: Identifying Resistance Between No. 1 And No. 4 Terminal Of Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Reconnect the floor wire harness 4P connector to the right side impact sensor (first) and right side impact sensor (second). If the DTCs are still indicated, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the floor wire harness; replace the floor wire harness.

DTC 43-2X, 43-8X, 43-9X, 43-AX, 43-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE LEFT SIDE IMPACT SENSOR (FIRST); DTC 44-2X, 44-8X, 44-9X, 44-AX, 44-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE RIGHT SIDE IMPACT SENSOR (FIRST)

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 43-2x, 43-8x, 43-9x, 43-Ax, 43-Bx, 44-2x, 44-8x, 44-9x, 44-Ax, or 44-Bx indicated?

YES - Replace the left or right side impact sensor (first) (see SIDE IMPACT SENSOR (FIRST) REPLACEMENT). If the DTC returns, replace the SRS unit (see SRS UNIT REPLACEMENT).

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

DTC 45-2X, 45-8X, 45-9X, 45-AX, 45-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE LEFT SIDE IMPACT SENSOR (SECOND); DTC 46-2X, 46-8X, 46-9X, 46-AX, 46-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE RIGHT SIDE IMPACT SENSOR (SECOND)

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 45-2x, 45-8x, 45-9x, 45-Ax, 45-Bx, 46-2x, 46-8x, 46-9x, 46-Ax, or 46-Bx indicated?

YES - Replace the left or right side impact sensor (second) (see SIDE IMPACT SENSOR (SECOND) REPLACEMENT). If the DTC returns, replace the SRS unit (see SRS UNIT REPLACEMENT).

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

DTC B1-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE ROLL RATE SENSOR; DTC B2-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE REAR SAFING SENSOR

Special Tools Required

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

- SRS inflator simulator 07SAZ-TB4011A
- SRS simulator lead L 070AZ-SNAA300

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), then wait for 10 seconds.
3. Read the DTC (see GENERAL TROUBLESHOOTING INFORMATION).

Is DTC B1-1x (except B1-11) indicated?

YES - Faulty roll rate sensor; replace the roll rate sensor (see ROLL RATE SENSOR REPLACEMENT).

NO - Go to step 4.

4. Read the DTC.

Is DTC B2-1x (except B2-11) indicated?

YES - Faulty rear safing sensor; replace the rear safing sensor (see REAR SAFING SENSOR REPLACEMENT).

NO - Go to step 5.

5. Read the DTC.

Is DTC B2-11 indicated?

YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time.

6. Turn the ignition switch OFF.
7. Check for damage to the floor wire harness between the SRS unit and rear safing sensor, rear safing sensor, and roll rate sensor.

Is the floor wire harness OK?

YES - Go to step 8.

NO - Replace the floor wire harness.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

8. Disconnect the negative cable from the battery, then wait for 3 minutes.
9. Replace the rear safing sensor with a known-good part (see **REAR SAFING SENSOR REPLACEMENT**).
10. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
11. Turn the ignition switch ON (II), and wait for 10 seconds.
12. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC B2-11 indicated?

YES - Go to step 13.

NO - Faulty rear safing sensor; replace the original rear safing sensor (see **REAR SAFING SENSOR REPLACEMENT**).

13. Turn the ignition switch to LOCK(0).
14. Disconnect the negative cable from the battery, then wait for 3 minutes.
15. Replace the roll rate sensor with a known-good part (see **ROLL RATE SENSOR REPLACEMENT**).
16. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
17. Turn the ignition switch ON (II), and wait for 10 seconds.
18. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC B2-11 indicated?

YES - Go to step 19.

NO - Faulty roll rate sensor; replace the original roll rate sensor (see **ROLL RATE SENSOR REPLACEMENT**).

19. Turn the ignition switch OFF.
20. Disconnect the negative cable from the battery, then wait for 3 minutes.
21. Disconnect SRS unit connector C (16P) from the SRS unit (see step 8).
22. Disconnect the floor wire harness 2P connector (A) from the roll rate sensor (see step 4).

Fig. 150: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Disconnect the floor wire harness 4P connector (A) from the rear safing sensor (see step 4).

Fig. 151: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Measure the resistance between the No. 2 and No. 3 terminal of the floor wire harness 4P connector. There should be an open circuit or at least 1Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 152: Identifying Resistance Between No. 2 And No. 3 Terminal Of Floor Wire Harness 4P

Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified ?

YES - Go to step 26.

NO - Short in the floor wire harness; replace the floor wire harness.

25. Measure the resistance between the No.1 and No. 4 terminal of the right side wire harness 4P connector. There should be an open circuit or at least 1Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 153: Identifying Resistance Between No.1 And No. 4 Terminal Of Right Side Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 27.

NO - Short in the floor wire harness; replace the floor wire harness.

26. Measure the resistance between the No. 2 terminal of floor wire harness 4P connector and body ground, and between the No. 3 terminal and body ground. There should be an open circuit or at least 1Mohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 154: Identifying Resistance Between No. 2 Terminal Of Floor Wire Harness 4P Connector And

Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 28.

NO - Short to ground in the floor wire harness; replace the floor wire harness.

27. Measure the resistance between the No. 1 terminal of floor wire harness 4P connector and body ground, and between the No. 4 terminal and body ground. There should be an open circuit or at least 1 M ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 155: Identifying Resistance Between No. 1 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 29.

NO - Short to ground in the floor wire harness; replace the floor wire harness.

28. Reconnect the negative cable to the battery.
29. Turn the ignition switch ON (II).
30. Measure the voltage between the No. 2 terminal of floor wire harness 4P connector and body ground, and between the No.3 terminal and body ground. There should be less than 0.2 V.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 156: Identifying Voltage Between No. 2 Terminal Of Floor Wire Harness 4P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 32.

NO - Short to power in the floor wire harness; replace the floor wire harness.

31. Turn the ignition to LOCK(0).
32. Install a jumper wire between the No. 4 terminal and No. 8 terminal of the SRS unit connector C (16P).

SRS UNIT CONNECTOR C (16P)

Wire side of female terminals

Fig. 157: Identifying Jumper Wire Between No. 27 Terminal And No. 28 Terminal Of SRS Unit Connector C (16P)

33. Measure the resistance between the No. 2 and No. 3 terminal of the floor wire harness 4P connector. There should be less than 1.0 ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 158: Identifying Resistance Between No. 2 And No. 3 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 35.

NO - Open in the floor wire harness; replace the floor wire harness.

34. Connect the SRS inflator simulator (jumper connector) and the brack lead (A) of simulator lead L to the floor wire harness 2P connector (B).

Fig. 159: Identifying Back Lead Of Simulator Lead L And Floor Wire Harness 2P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Measure the resistance between the No. 1 and No. 4 terminal of the floor wire harness 4P connector. There should be less than 1.0 ohms.

FLOOR WIRE HARNESS 4P CONNECTOR

Terminal side of female terminals

Fig. 160: Identifying Resistance Between No. 1 And No. 4 Terminal Of Floor Wire Harness 4P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Reconnect the floor wire harness 4P connector to the rear safing sensor and roll rate sensor. If the DTCs are still indicated, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the floor wire harness; replace the floor wire harness.

DTC B1-2X, B1-8X, B1-9X, BI-AX, BI-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE ROLL RATE SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC B1-2x, B1-8x, B1-9x, B1-Ax, or B1-Bx indicated?

YES - Replace the roll rate sensor (see **ROLL RATE SENSOR REPLACEMENT**). If the DTC returns, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

DTC B2-2X, B2-8X, B2-9X, B2-AX, B2-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE REAR SAFING SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General

Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC B2-2x, B2-8x, B2-9x, B2-Ax, or B2-Bx indicated?

YES - Replace the rear safing sensor (see REAR SAFING SENSOR REPLACEMENT). If the DTC returns, replace the SRS unit (see SRS UNIT REPLACEMENT).

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

DTC 51-XX, 52-XX, 53-XX, 54-XX, 55-XX, 57-XX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE SRS UNIT

NOTE:

- Before troubleshooting any of these DTCs, check the battery/system voltage and battery cable corrections. If the voltage is low, repair the charging system or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the client if the battery ever went dead or if the engine was started and run with the battery in a low state of charge. A dead battery may trigger one or more of these DTCs.
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 51-xx, 52-xx, 53-xx, 54-xx, 55-xx, or 57-xx indicated?

YES - Replace the SRS unit (see SRS UNIT REPLACEMENT).

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

DTC EX-XX ("X" CAN BE 0 THRU 9 OR A THRU F): CONTROL OPERATION RECORDED; DTC FX-XX ("X" CAN BE 0 THRU 9 OR A THRU F): AIRBAGS AND/OR TENSIONERS DEPLOYMENT RECORDED

NOTE:

- Before doing this troubleshooting procedure, review SRS Precautions

and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

- DTC E2-11: Front passenger's airbag did not deploy by SWS operation.
- DTC E4-11: Front left side airbag did not deploy by OPDS operation.
- DTC F1-11: Driver's airbag and/or driver's seat belt tensioner deployed.
- DTC F2-11: Front passenger's airbag and/or front passenger's seat belt tensioner deployed.
- DTC F3-11: Driver's side airbag, left side curtain airbag, and/or driver's seat belt tensioner deployed.
- DTC F4-11: Front passenger's side airbag, right side curtain airbag, and/or front passenger's seat belt tensioner deployed.
- DTC F5-11: One or both side curtain airbag, and seat belt tensioner deployed.
- DTC F6-11: Left side curtain airbag or right side curtain airbag deployed.

The SRS unit must be replaced after any airbags and/or tensioners have deployed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

NOTE:

- DTC E2-11 is set if the system triggered airbag deployment but the front passenger's airbag was prevented from deploying because of the seat weight sensor.
- DTC E4-11 is set if the system triggered a passenger's side airbag deployment but the airbag was prevented from deploying by the ODS. Replace the right side impact sensor (first) (see SIDE IMPACT SENSOR (FIRST) REPLACEMENT).
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

DTC 61-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN DRIVER'S SEAT BELT BUCKLE SWITCH

NOTE:

Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), then buckle and unbuckle the driver's seat belt several times.
3. Read the DTC (see GENERAL TROUBLESHOOTING INFORMATION).

Is DTC 61-1x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

4. Disconnect the driver's seat harness 3P connector from the driver's seat belt buckle switch 3P connector (A).

Fig. 161: Identifying Driver's Seat Belt Buckle Switch 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. From the system selection menu on the HDS, select SRS, then select SRS again, then select PARAMETER INFORMATION, then Buckle Switch. Seat Position Sensor, and check the status on the HDS screen for FRONT LEFT SEAT BELT BUCKLE SWITCH when the seat belt is buckled, and unbuckled.
 - If UNBUCKLE, BUCKLE, or SHORT is indicated replace the driver's seat wire harness, or floor wire harness; replace the faulty harness.
 - If OPEN is indicated, go to step 6.
6. Measure the resistance between the No. 3 terminal of the driver's seat wire harness 3P connector and body ground. There should be less than 1 ohms.

DRIVER'S SEAT WIRE HARNESS 3P CONN

Wire side of female terminals

Fig. 162: Identifying Resistance Between No. 3 Terminal Of Driver's Seat Wire Harness 3P

Connector And Body Ground**Courtesy of AMERICAN HONDA MOTOR CO., INC.**

Is the resistance as specified?

YES - Go to step 7.

NO - Open in the driver's seat wire harness or floor wire harness or poor ground connection at G602 (see **FLOOR WIRE HARNESS (LEFT BRANCH)**). If G602 is OK, replace the faulty harness.

7. Alternately connect the No. 2 and No. 3 terminals of the driver's seat wire harness 3P connector to body ground with a jumper wire, and check the status on the HDS screen.

Does the status alternate from UNBUCKLE to BUCKLE?

YES - Replace the driver's seat belt buckle assembly (see **SEAT BELT BUCKLE**), then clear the DTC.

NO - Open in the driver's seat wire harness or floor wire harness; replace the faulty harness.

DTC 61-2X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT IN DRIVER'S SEAT BELT BUCKLE SWITCH

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), then buckle and unbuckle the driver's seat belt several times.
3. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 61-2x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK(0).
5. Disconnect the driver's seat wire harness 3P connector from the driver's seat belt buckle switch 3P connector (A).

Fig. 163: Identifying Driver's Seat Belt Buckle Switch 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II).
7. From the system selection menu on the HDS, select SRS, then select SRS again, then select PARAMETER INFORMATION, then Buckle Switch, Seat Position Sensor, and Check the status on the HDS screen for FRONT LEFT SEAT BELT BUCKLE SWITCH.

Is OPEN indicated on the HDS?

YES - Replace the driver's seat belt buckle assembly (see SEAT BELT BUCKLE), then clear the DTC.

NO - Short to ground in the driver's seat wire harness or floor wire harness; replace the faulty wire harness.

DTC 62-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN FRONT PASSENGER'S SEAT BELT BUCKLE SWITCH

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), then buckle and unbuckle the driver's seat belt several times.
3. Read the DTC (see GENERAL TROUBLESHOOTING INFORMATION).

Is DTC 62-1x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

4. Disconnect the front passenger's seat wire harness 3P connector from the front passenger's seat belt buckle switch 3P connector (A).

Fig. 164: Identifying Front Passenger's Seat Belt Buckle Switch 3P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. From the system selection menu on the HDS, select SRS, then select SRS again, then select PARAMETER INFORMATION, then Buckle Switch. Seat Position Sensor, and check the status on the HDS screen for FRONT RIGHT SEAT BELT BUCKLE SWITCH when the seat belt is buckled, and unbuckled.
 - If UNBUCKLE, BUCKLE, or SHORT is indicated open in the front passenger's seat wire harness, or floor wire harness; replace the faulty harness.
 - If OPEN is indicated, go to step 6.
6. Measure the resistance between the No. 3 terminal of the front passenger's seat wire harness 3P connector and body ground. There should be 0-1 ohms.

**FRONT PASSENGER'S SEAT WIRE
 HARNESS 3P CONNECTOR**

Wire side of female terminals

Fig. 165: Identifying Resistance Between No. 3 Terminal Of Front Passenger's Seat Wire Harness 3P Connector And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified ?

YES - Go to step 7.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

NO - Open in the front passenger's seat wire harness or floor wire harness or poor ground connection at G602 (see **FLOOR WIRE HARNESS (LEFT BRANCH)**). If G602 is OK, replace the faulty harness.

7. Alternately connect the NO; 2 and No. 3 terminals of the front passenger's seat wire harness 3P connector to body ground with a jumper wire, and check the status on the HDS screen.

Does the status alternate from UNBUCKLE to BUCKLE?

YES - Replace the front passenger's seat belt buckle assembly (see **SEAT BELT BUCKLE**), then clear the DTC.

NO - Open in the front passenger's seat wire harness or floor wire harness; replace the faulty harness.

DTC 62-2X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT IN FRONT PASSENGER'S SEAT BELT BUCKLE SWITCH

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), then buckle and unbuckle the front passenger's seat belt several times.
3. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 62-2x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK(0).
5. Disconnect the front passenger's seat wire harness 3P connector from the front passenger's seat belt buckle switch 3P connector (A).

Fig. 166: Identifying Front Passenger's Seat Belt Buckle Switch 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON
7. From the system selection menu on the HDS, select SRS, then select SRS again, then select PARAMETER INFORMATION, then Buckle Switch, Seat Position Sensor, and check the status on the HDS screen for FRONT RIGHT SEAT BELT BUCKLE SWITCH.

Is OPEN indicated on the HDS?

YES - Replace the front passenger's seat belt buckle assembly (see **SEAT BELT BUCKLE**), then clear the DTC.

NO - Short to ground in the front passenger's seat wire harness or floor wire harness; replace the faulty harness.

DTC 71-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN DRIVER'S SEAT POSITION SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 71-1x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING**

INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Check the connection between the driver's seat wire harness 2P connector and the driver's seat position sensor (see **COMPONENT LOCATION INDEX**).
4. Clear the DTC memory.
5. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 71-1x indicated?

YES - Go to step 6.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

6. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
7. Disconnect the driver's seat wire harness 2P connector from the driver's seat position sensor (A).

Fig. 167: Identifying Driver's Seat Position Sensor
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the No. 1 and No. 2 terminals of the driver's seat wire harness 2P connector with a jumper wire.

DRIVER'S SEAT WIRE HARNESS 2P CONNECTOR

Wire side of female terminals

Fig. 168: Identifying No. 1 And No. 2 Terminals Of Driver's Seat Wire Harness 2P Connector With Jumper Wire

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Disconnect both seat belt tensioner connectors (see step 7).
10. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
11. Measure the resistance between the No. 5 and No. 6 terminals of SRS unit connector B (28P). There should be 0-1.0 ohms.

SRS UNIT CONNECTOR B (28P)

Wire side of female terminals

Fig. 169: Identifying Resistance Between No. 5 And No. 6 Terminals Of SRS Unit Connector B (28P)**Courtesy of AMERICAN HONDA MOTOR CO., INC.***Is the resistance as specified?*

YES - Faulty driver's seat position sensor or SRS unit; replace the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**). If the problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the floor wire harness or the driver's seat wire harness; replace the faulty harness.

DTC 71-2X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT IN DRIVER'S SEAT POSITION SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 71-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
4. Disconnect the driver's seat wire harness 2P connector from the driver's seat position sensor (A) (see **COMPONENT LOCATION INDEX**).

Fig. 170: Identifying Driver's Seat Position Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reconnect the negative cable to the battery.
6. Clear the DTC memory.
7. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC 71-2x indicated?

YES - Go to step 8.

NO - Faulty driver's seat position sensor; replace the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**).

8. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
9. Disconnect both seat belt tensioner connectors (see step 7).
10. Disconnect SRS unit connector B (28P) from the SRS unit (see step 8).
11. Measure the resistance between the No. 5 and No. 6 terminals of SRS unit connector B (28P). There should be an open circuit or at least 1M ohms.

SRS UNIT CONNECTOR B (28P)

Wire side of female terminals

Fig. 171: Identifying Resistance Between No. 5 And No. 6 Terminals Of SRS Unit Connector B (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 12.

NO - Short in the floor wire harness or the driver's seat wire harness; replace the faulty harness.

12. Measure the resistance between the No. 5 terminal of SRS unit connector B (28P) and body ground, and between the No. 6 terminal and body ground. There should be an open circuit or at least 1Mohms.

SRS UNIT CONNECTOR B (28P)

Wire side of female terminals

Fig. 172: Identifying Resistance Between No. 5 Terminal Of SRS Unit Connector B (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty driver's seat position sensor or the SRS unit; replace the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**). If the problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short in the floor wire harness or the driver's seat wire harness; replace the faulty harness.

FROM THE ODS UNIT

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

1. Make sure nothing is on the front passenger's seat.
2. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
3. Read the DTC (see GENERAL TROUBLESHOOTING INFORMATION).

Is DTC 81-61, 85-61, 81-62, or 85-62 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

4. Check the connection between the ODS unit harness 18P connector and the ODS unit.

Is the connection OK?

YES - Go to step 6.

NO - Repair the poor connection and retest. If DTC 85-61 or 85-62 is still present, go to step 5.

5. Turn the ignition switch OFF.
6. Check the No. 20 (7.5 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?

YES - Go to step 7.

NO - Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 20 (7.5 A) fuse circuit (floor wire harness or ODS unit harness).

7. Disconnect the ODS unit harness 18P connector (A) from the ODS unit.

Fig. 173: Identifying ODS Unit Harness 18P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch ON (II).
9. Measure the voltage between the No. 1 terminal of the ODS unit harness 18P connector and body ground. There should be battery voltage.

ODS UNIT HARNESS 18P CONNECTOR

Wire side of female terminals

Fig. 174: Identifying Voltage Between No. 1 Terminal Of ODS Unit Harness 18P Connector And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Open in the floor wire harness or ODS unit harness; replace the faulty harness.

10. Turn the ignition switch OFF.
11. Measure the resistance between the No. 12 terminal of the ODS unit harness 18P connector and body ground. There should be 0-1.0 ohms.

ODS UNIT HARNESS 18P CONNECTOR

Wire side of female terminals

Fig. 175: Identifying Resistance Between No. 12 Terminal Of ODS Unit Harness 18P Connector And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 12.

NO - Open in the ODS unit harness, floor wire harness, or poor ground connection at G605 (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**). If G605 is OK, replace the faulty harness.

12. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
13. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
14. Measure the resistance between the No. 14 terminal of SRS unit connector A (28P) and body ground. There should be an open circuit or at least 1 Mohms.

SRS UNIT CONNECTOR A (28P)

Wire side of female terminals

Fig. 176: Identifying Resistance Between No. 14 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 15.

NO - Short to ground in the dashboard wire harness or floor wire harness; replace the faulty harness.

15. Turn the ignition switch ON (II), and measure the voltage between the No. 14 terminal of SRS unit connector A (28P) and body ground. There should be less than 0.2 V .

Fig. 177: Identifying Voltage Between No. 14 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 16.

NO - Short to power in the dashboard wire harness or floor wire harness; replace the faulty harness.

16. Measure the resistance between the No. 14 terminal of SRS unit connector A (28P) and the No. 7 terminal of the ODS unit harness 18P connector. There should be 0-1.0 ohms.

Fig. 178: Identifying Resistance Between No. 14 Terminal Of SRS Unit Connector A (28P) And No. 7 Terminal Of ODS Unit Harness 18P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty ODS unit or SRS unit; replace the ODS unit (see **ODS UNIT REPLACEMENT**). If the

problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the dashboard wire harness or floor wire harness; replace the faulty harness.

DTC 81-71,81-78: ODS UNIT DOES NOT CALIBRATE

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is 81-71 or 81-78 indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Calibrate the ODS unit (see **ODS UNIT CALIBRATION**).
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Go to step 5.

5. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
6. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

DTC 85-71,85-78: ODS UNIT NOT INITIALIZED

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and

Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is 85-71 or 85-78 indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Initialize the ODS unit (see ODS UNIT INITIALIZATION).
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - GO to step 5.

5. Replace the ODS unit (see ODS UNIT REPLACEMENT).
6. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Replace the SRS unit (see SRS UNIT REPLACEMENT).

DTC 81-4X, 81-63,81-64 ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE ODS UNIT

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

goes off.

Does the SRS indicator stay on, and is DTC 81-4x, 81-63, or 81-64 indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Initialize the ODS unit (see **ODS UNIT INITIALIZATION**).
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - GO to step 5.

5. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
6. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

DTC 81-79: FRONT PASSENGER'S WEIGHT SENSORS INITIAL CHECK FAILURE

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 81-79 indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

3. Turn the ignition to LOCK(0).
4. Make sure nothing is on the front passenger's seat.
5. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Remove the front passenger's seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**) and the front passenger's weight sensors (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then reinstall them. Calibrate the ODS unit (see **ODS UNIT CALIBRATION**). Retry the troubleshooting. If DTC 81-79 is still present, replace the front passenger's weight sensors.

DTC 82-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 82-1x indicated?

YES - Replace the inner side front passenger's weight sensor (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

DTC 83-2X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

Does the SRS indicator stay on, and is DTC 83-2x indicated?

YES - Replace the outer side front passenger's weight sensor (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

DTC 85-4X ("X" CAN BE 0 THRU 9 OR A THRU F), 85-63,85-64: INTERNAL FAILURE OF THE ODS UNIT

NOTE:

- An incorrect ODS unit can cause DTC 85-63.
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 85-4x, 85-5x, 85-63, or 85-64 indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Initialize the ODS unit (see **ODS UNIT INITIALIZATION**).
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Replace the ODS unit (see **ODS UNIT REPLACEMENT**) and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

DTC 85-79: OPDS SENSOR INITIAL CHECK FAILURE

NOTE:

Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 85-79 indicated?

YES - Turn the ignition switch OFF, and go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

3. Make sure nothing is on the front passenger's seat.
4. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Go to step 5.

5. Initialize the ODS unit (see **ODS UNIT INITIALIZATION**).
6. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator go off?

YES - The system is OK.

NO - Replace the ODS unit (see **ODS UNIT REPLACEMENT**) and retest. If the problem is still present, replace the OPDS sensor/seat-back (see **FRONT SEAT-BACK COVER REPLACEMENT**). If the DTC is still present, the SRS unit (see **SRS UNIT REPLACEMENT**).

DTC 86-1 X, 86-2X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY OPDS SENSOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 86-1x or 86-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

NOTE: Aftermarket devices (fluorescent lights, laptop computers, etc.) used near the front passenger's seat-back can interfere with the seat-back sensors and cause a false DTC 86-1x or 86-2x. If one of these devices was used, erase the DTC, operate the device near the seat-back, and recheck for DTCs. If DTC 86-1x or 86-2x is set, erase it, and do not use the device near the seat-back.

3. Check the connection at the OPDS sensor harness connectors (A) and the ODS unit connector (B).

Fig. 179: Identifying OPDS Sensor Harness Connectors And ODS Unit Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Are the connections OK?

YES - Go to step 4.

NO - Repair the poor connections, and clear the DTC.

4. Replace the OPDS sensor/seat-back foam (see **FRONT SEAT-BACK COVER REPLACEMENT**), and initialize the ODS unit (see **ODS UNIT INITIALIZATION**).
5. Erase the DTC memory, then check for DTC 86-1x or 86-2x.

Is DTC 86-1x or 86-2x indicated?

YES - Replace the ODS unit (see **ODS UNIT REPLACEMENT**).

NO - The system is OK.

DTC 92-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE PASSENGER'S AIRBAG CUTOFF INDICATOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and is DTC 92-1x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Disconnect the passenger's airbag cutoff indicator 6P connector (see PASSENGER'S AIRBAG CUTOFF INDICATOR ILLUMINATION BULB TEST).
4. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
5. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
6. Reconnect the negative cable to the battery.
7. Turn the ignition switch ON (II).
8. Measure the voltage between the No. 13 terminal of SRS unit connector A (28P) and body ground. There should be 0.5 V or less.

Fig. 180: Identifying Voltage Between No. 13 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or passenger's airbag cutoff indicator; replace the passenger's airbag cutoff indicator. If the problem is still present, replace the SRS unit (see SRS UNIT REPLACEMENT).

NO - Short to power in the dashboard wire harness; replace the dashboard wire harness.

DTC 92-2X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN OR SHORT TO GROUND IN PASSENGER'S AIRBAG CUTOFF INDICATOR

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

1. Clear the DTC memory (see CLEAR THE DTC MEMORY WITH THE HDS).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.

Does the SRS indicator stay on, and DTC 92-2x indicated?

YES - Go to step 3.

NO - Intermittent failure, the system is OK at this time. Go to TROUBLESHOOTING INTERMITTENT FAILURES (see). If another DTC is indicated, troubleshoot the DTC.

3. Disconnect the passenger's airbag cutoff indicator 6P connector (see PASSENGER'S AIRBAG CUTOFF INDICATOR ILLUMINATION BULB TEST).
4. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
5. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
6. Measure the resistance between the No. 2 terminal of the passenger's airbag cutoff indicator 6P connector and the No. 13 terminal of SRS unit connector A (28P). There should be 0-1.0 ohms.

Fig. 181: Identifying Resistance Between No. 2 Terminal Of Passenger's Airbag Cutoff Indicator 6P Connector And No. 13 Terminal Of SRS Unit Connector A (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 7.

NO - Open in the dashboard wire harness; replace the dashboard wire harness.

7. Measure the resistance between the No. 13 terminal of the SRS unit connector A (28P) and body ground. There should be an open circuit or at least 1 Mohms.

Fig. 182: Identifying Resistance Between No. 13 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Replace the passenger's airbag cutoff indicator. If the problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the dashboard wire harness; replace the dashboard wire harness.

DTC A1-1X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY POWER SUPPLY (VA LINE)

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**) and General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**), and Battery Terminal Disconnection and Reconnection (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

1. Clear the DTC memory (see **CLEAR THE DTC MEMORY WITH THE HDS**).
2. Turn the ignition switch ON (II), and check that the SRS indicator comes on for about 6 seconds and then goes off.
3. Read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**).

Is DTC A1-1x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES** (see). If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch OFF.
5. Check the No. 20 (7.5 A) fuse in the under-dash fuse/relay box.

Is the fuse OK?

YES - Go to step 6.

NO - Replace the fuse, then turn the ignition switch ON (II). If the fuse blows again, check for a short in the No. 20 (7.5 A) fuse circuit (dashboard wire harness, floor wire harness, or ODS unit harness).

6. Disconnect the negative cable from the battery, then wait for 3 minutes.
7. Disconnect the SRS unit connector A (28P) from the SRS unit (see step 8).
8. Turn the ignition switch ON (II).
9. Measure the voltage between the No. 17 terminal of SRS unit connector A (28P) and body ground. Turn the ignition switch ON (II), and measure the voltage. There should be battery voltage when the ignition is on.

Fig. 183: Identifying Voltage Between No. 17 Terminal Of SRS Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Faulty SRS unit or poor connection at SRS unit connector (A) 28P and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Go to step 10.

10. Turn the ignition switch OFF.
11. Disconnect under-dash fuse/relay box connector X (39P).

Fig. 184: Identifying Under-Dash Fuse/Relay Box Connector X (39P)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Measure the resistance between the No. 36 terminal of under-dash fuse/relay box connector X (39P) and the No. 17 terminal of SRS unit connector A (28P). There should be 0-1.0 ohms.

Fig. 185: Identifying Resistance Between No. 36 Terminal Of Under-Dash Fuse/Relay Box Connector X (39P) And No. 17 Terminal Of SRS Unit Connector A (28P)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Open in the under-dash fuse/relay box or poor contact between connector X (39P) and the under-dash fuse/relay box; check the connection. If the connection is OK, replace the under-dash fuse/ relay box (see **REMOVAL AND INSTALLATION**).

NO - Open in the dashboard wire harness; replace the dashboard wire harness.

DTC A2-1X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY POWER SUPPLY (VB LINE)

NOTE: Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

1. Check the No. 22 (10 A) fuse in the under-dash fuse/ relay box.

Is the fuse OK?

YES - Go to step 11.

NO - Go to step 2.

2. Replace the No. 22 (10 A) fuse.
3. Turn the ignition switch ON (II) and wait for 30 seconds. Then turn the ignition switch OFF.
4. Check the No. 22 (10 A) fuse.

Is the fuse OK?

YES - The system is OK at this time.

NO - Go to step 5.

5. Replace the No. 22 (10 A) fuse.
6. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
7. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch ON (II), and wait for 30 seconds. Then turn the ignition switch OFF.
10. Check the No. 22 (10 A) fuse.

Is the fuse OK?

YES - Short to ground in the SRS unit; replace the SRS unit (see SRS UNIT REPLACEMENT).

NO - Short to ground in the dashboard wire harness or in the under-dash fuse/relay box No. 22 (10 A) fuse line; replace the dashboard wire harness. If the problem is still there, replace the under-dash fuse/relay box (see REMOVAL AND INSTALLATION).

11. Turn the ignition switch OFF. Disconnect the negative cable from the battery, then wait for 3 minutes.
12. Disconnect SRS unit connector A (28P) from the SRS unit (see step 8).
13. Reconnect the negative cable to the battery.

14. Measure the voltage between the No. 18 terminal of SRS unit connector A (28P) and body ground. Turn the ignition switch ON (II), and measure the voltage. There should be battery voltage with the ignition on.

Fig. 186: Identifying Voltage Between No. 18 Terminal Of Srs Unit Connector A (28P) And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Faulty SRS unit or poor connection at SRS unit connector A (28P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Go to step 15.

15. Turn the ignition switch OFF.
16. Disconnect under-dash fuse/relay box connector S (2P).

Fig. 187: Identifying Under-Dash Fuse/Relay Box Connector S (2P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Measure the resistance between the No. 1 terminal of the under-dash fuse/relay box connector S (2P) and the No. 18 terminal of SRS unit connector A (28P). There should be 0-1.0 ohms.

Fig. 188: Identifying Resistance Between No. 1 Terminal Of Under-Dash Fuse/Relay Box Connector S (2P) And No. 18 Terminal Of SRS Unit Connector A (28P)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Open in the under-dash fuse/relay box or poor connection between connector S (2P) and the under-dash fuse/relay box; check the connection. If the connection is OK, replace the under-dash fuse/ relay box (see **REMOVAL AND INSTALLATION**).

NO - Open in the dashboard wire harness; replace the dashboard wire harness.

SYMPTOM TROUBLESHOOTING

SRS INDICATOR DOES NOT COME ON

1. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Check for PGM-FI, Body Electrical, and SRS DTCs with the HDS.

Are there any PGM-FI, Body Electrical, or SRS DTCs?

YES - Go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - Go to step 5.

5. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

Does the SRS indicator come on?

YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO -Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL**).

MODULE REPLACEMENT).**SRS INDICATOR STAYS ON, BUT NO DTCS ARE STORED**

1. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
2. Turn the ignition switch ON (II).
3. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select Body Electrical status with the HDS.
5. Check for DTCs in the Gauge Menu with the HDS.

Is DTC B1187 indicated?

YES - Go to the DTC B1187 troubleshooting.

NO - Go to step 6.

6. Check that the HDS communicate with the SRS unit.

Does the HDS communicate with the SRS unit?

YES - Go to step 7.

NO - If the HDS does not communicate with the SRS unit, check for power and ground at SRS unit connector A (28P). If power and ground are still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

7. From the HDS System Menu, select SRS, then SRS in Mode Menu, PARAMETER INFORMATION, then SCS, MES, Indicator. Read the current status of the SRS indicator.

Is the status ON?

YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

SIDE AIRBAG CUTOFF INDICATOR STAYS ON

1. Make sure nothing is on the front passenger's seat.
2. Make sure the seat-back is dry.
3. Turn the ignition switch ON (II), and see if the SRS indicator comes on.

Does the SRS indicator come on?

YES - Go to the **SYMPTOM TROUBLESHOOTING "SRS INDICATOR STAY ON"**.

NO - Go to step 4.

4. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
6. From the Main Menu on the HDS, select SRS, then PARAMETER INFORMATION. In the PARAMETER INFORMATION Menu, select "SCS, MES, Indicator," and read the HDS screen.

Is OFF indicated on the HDS?

YES - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

NO - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

SIDE AIRBAG CUTOFF INDICATOR DOES NOT COME ON

NOTE: If the SRS indicator also stays on, go to SRS indicator stays on, but no DTCs are stored (see **SRS indicator does not come on**).

1. Turn the ignition switch ON (II), and check that the side airbag cutoff indicator comes on for about 6 seconds.

Does the side airbag cutoff indicator come on?

YES - Go to the **SYMPTOM TROUBLESHOOTING "SRS INDICATOR STAY ON"**.

NO - Go to step 2.

2. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
3. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Do the gauge control module self diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

Does the side airbag cutoff indicator come on?

YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

PASSENGER'S AIRBAG CUTOFF INDICATOR STAYS ON OR COMES ON SUDDENLY

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

NOTE: Under the following conditions, the passenger's airbag cutoff indicator stays on or comes on suddenly.

- No one is sitting the front passenger's seat, but there is an object on the seat more than 5 kg (11 lbs).
 - The seat belt is buckled, but no one is sitting on the front passenger's seat.
 - Someone who is less than 30 kg (66 lbs) is sitting on the front passenger's seat.
1. Check for these items, then recheck the passenger's airbag cutoff indicator.
 - The front passenger's seat is installed correctly.
 - Nothing is/was on the front passenger's seat.
 - Nothing is/was under the front passenger's seat.
 - Nothing is/was in the front passenger's seat-back pocket.
 - Whoever was sitting on the front passenger's seat was sitting in the proper sitting position.
 - Someone who is more than 30 kg (66 lbs) but is supporting some of their body weight on their legs, feet, arms, or hands.

Does the passenger's airbag cutoff indicator stay on?

YES - Go to step 2.

NO - Troubleshooting is complete.

2. Connect the HDS to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).
3. Turn the ignition switch ON (II).
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select the INSPECTION menu on the HDS, then select AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S), and follows the problems.

Does the passenger's airbag cutoff indicator stay on?

YES - Go to step 6.

NO - Troubleshooting is complete.

6. Select the INSPECTION menu on the HDS, then select AFTER A VEHICLE COLLISION, and follow the prompts.

Does the passenger's airbag cutoff indicator stay on?

YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Troubleshooting is complete.

COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT

NOTE:

- Before doing any SRS repairs, use the HDS SRS menu method to check for DTCs; refer to the DTC TROUBLESHOOTING INDEX for the less obvious deployed parts (seat belt tensioners, front impact sensors, side airbag sensors, etc.)
- Do not replace the ODS unit unless it is physically damaged or a specific fault was found during DTC troubleshooting.
- After a vehicle collision, do the ODS unit operation check (see ODS UNIT OPERATION CHECK).

After a collision where the seat belt tensioners deployed, replace these items:

- SRS unit
- Seat belt tensioners
- Front impact sensors

After a collision where the front airbag(s) deployed, replace these items:

- SRS unit
- Deployed airbag(s)
- Seat belt tensioners
- Front impact sensors

After a collision where the side airbag(s) deployed, replace these items:

- SRS unit
- Deployed side airbag(s)
- Reinforcing cloth rear hooks
- Side impact sensor(s) (first) for the side(s) that deployed
- Side impact sensor(s) (second) for the side(s) that deployed
- B-pillar lower trim
- Complete seat frame

After a collision where a side curtain airbag has deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side curtain airbag(s)
- Seat belt tensioner(s) for the side(s) that deployed
- Side impact sensor(s) (first) for the side(s) that deployed
- Side impact sensor(s) (second) for the side(s) that deployed

- Rear safing sensor
- Roll rate sensor
- Roof trim
- A-pillar trim
- B-pillar upper trim
- Quarter pillar trim
- Front grab handle
- Rear grab handle
- All related trim clips
- Sunvisor

After a moderate to severe side or rear collision, inspect for any damage on the side curtain airbag or other related components. Replace the components as needed.

A-pillar trim

Fig. 189: Identifying A-Pillar Trim

Courtesy of AMERICAN HONDA MOTOR CO., INC.

B-pillar trim

Fig. 190: Identifying B-Pillar Trim

Courtesy of AMERICAN HONDA MOTOR CO., INC.

C-Pillar trim

Fig. 191: Identifying C-Pillar Trim

Courtesy of AMERICAN HONDA MOTOR CO., INC.

During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, do not repair, any damaged harnesses.
- Inspect the cable reel for heat damage. If there is any damage, replace the cable reel.

After the vehicle is completely repaired, turn the ignition switch ON (II). If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS SRS Menu Method to read the DTC (see **GENERAL TROUBLESHOOTING INFORMATION**). If you cannot retrieve a code, do the SRS Symptom Troubleshooting.

CHECKING AND ADJUSTING THE HEADLINER/PILLAR TRIM OVERLAP

To prevent the side curtain airbag from deploying and damaging the pillar trim, the overlap between the headliner and pillar trim must be less than 0.3 in. (8 mm). To check the overlap, do this:

1. Install the headliner (A) and the pillar trim (B).

Fig. 192: Identifying Headliner And Pillar Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Using masking tape on the headliner, mark the upper edge of each pillar trim.

Fig. 193: Identifying Upper Edge Of Pillar Trim Using Masking Tape On Headliner
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the pillar trim, and measure the headliner overlap.
 - If the overlap is less than 0.3 in. (8 mm), remove the tape, and install the pillar trim.
 - If the overlap is more than 0.3 in. (8 mm), go to step 4.

Fig. 194: Identifying Headliner Overlap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Carefully trim the headliner with a utility knife, reducing the overlap to less than 0.3 in. (8 mm).

Fig. 195: Identifying Headliner With Utility Knife, Reducing Overlap To Less Than 0.3 in. (8 mm)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the tape, and install the pillar trim.

DRIVER'S AIRBAG REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Remove the access panel (A) from the steering wheel, then disconnect the driver's airbag 4P connector (B) and horn switch IP connector (C) from the cable reel.

Fig. 196: Identifying Access Panel, Driver's Airbag 4P Connector And Horn Switch IP Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Using a TORX T30 bit, remove the two TORX bolts (A).

Fig. 197: Identifying TORX Bolts Using TORX T30 Bit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the driver's airbag (B).

INSTALLATION

1. Connect the horn switch connector (1P) (A) to the driver's airbag (B).

Fig. 198: Identifying Horn Switch Connector (1P) And Driver's Airbag With torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the driver's airbag in the steering wheel, and secure it with new TORX bolts (C).
3. Connect the cable reel 4P connector (A) to the driver's airbag 4P connector and horn switch 1P connector (B), then install the access panel (C) on the steering wheel.

Fig. 199: Identifying Cable Reel 4P Connector, Horn Switch 1P Connector And Access Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reconnect the negative cable to the battery.
5. After installing the airbag, confirm proper system operation:
 - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
 - Make sure the horn works.

FRONT PASSENGER'S AIRBAG REPLACEMENT

REMOVAL

NOTE: If the front passenger's airbag has been deployed, refer to the install for after a collision where the front passenger's airbag deployed.

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
3. Disconnect the front passenger's airbag 4P connector (A) from dashboard wire harness.

Fig. 200: Identifying Front Passenger'S Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the bracket (A).

Fig. 201: Identifying Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the mounting nuts (A) and mounting bolts (B) from the bracket. Remove the front passenger's airbag (C).

Fig. 202: Identifying Bracket Mounting Nuts, Bolts And Front Passenger's Airbag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Place the new front passenger's airbag (A) into the bracket. Torque the front passenger's airbag mounting nuts (B) and mounting bolts (C).

Fig. 203: Identifying Bracket Mounting Nuts, Bolts And Front Passenger's Airbag With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reinstall the bracket (D).

3. Connect the front passenger's airbag 4P connector (A) to dashboard wire harness, then reinstall the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).

Fig. 204: Identifying Front Passenger'S Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reconnect the negative cable to the battery.
5. Connect the HDS and clear the DTCs.
6. After installing the airbag, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

SIDE AIRBAG REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect the side airbag harness 2P connector (A).

Fig. 205: Identifying Side Airbag Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**) and seat-back cover (see **FRONT SEAT-BACK COVER REPLACEMENT**).

NOTE: If you are replacing a deployed airbag, replace the reinforcing cloth rear hooks (A).

Fig. 206: Identifying Reinforcing Cloth Rear Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the mounting nut (B) and the side airbag (C).

INSTALLATION

NOTE:

- If the side airbag lid is secured with tape, remove the tape. :
- Do not open the lid on the side airbag cover.
- Use new mounting nuts tightened to the specified torque.
- Make sure that the seat-back cover is installed properly. Improper installation may prevent proper deployment.
- Be sure to install the harness wires so that they are not pinched or interfering with other parts.

1. Place the new side airbag on the seat-back frame (A). Torque the new side airbag mounting nut (B).

Fig. 207: Identifying Seat-Back Frame And Side Airbag Mounting Nut With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the seat-back cover in the reverse order of removal (see **FRONT SEAT-BACK COVER REPLACEMENT**).

NOTE: If you are replacing a deployed airbag, replace the reinforcing cloth rear hooks.

3. Install the seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**), then connect the side airbag harness 2P connector.
4. Move the front seat and the seat-back through their full ranges of movement, making sure the harness wires are not pinched or interfering with other parts.
5. Reconnect the negative cable to the battery.
6. Connect the HDS, and clear the DTCs (see **CLEAR THE DTC MEMORY WITH THE HDS**).
7. After installing the side airbag, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

SIDE CURTAIN AIRBAG REPLACEMENT

REMOVAL

NOTE:

- Review the interior trim replacement procedure before doing repair or service (see **QUARTER PILLAR TRIM**).
- Removal of the side curtain airbag must be done according to Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**).
- The side curtain airbag system consists of many components. After the side curtain airbag has been deployed, go to **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**, and replace all of the parts listed (see **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**).

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Remove the headliner (see **HEADLINER REMOVAL/INSTALLATION**).
3. Disconnect the side curtain airbag 2P connector (A) from the floor wire harness.

Left side shown; right side is similar.

Fig. 208: Identifying Side Curtain Airbag 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the mounting bolts (A) and mounting bolts (B) from the bracket. Detach the clips (C), then remove the side curtain airbag (D).

2008 Acura MDX

2007-09 RESTRAINTS SRS (Supplemental Restraint System) - MDX

Left side shown; right side similar.

Fig. 209: Identifying Mounting Bolts, Bracket And Side Curtain Airbag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

NOTE:

- Installation of the side curtain airbag must be done according to Precautions and Procedures (see PRECAUTIONS AND PROCEDURES).
- If the airbag is frayed, or has any other visible damage, replace it. Do not

attempt to repair an airbag.

- When you install the airbag, make sure it is not twisted, and that it is not caught between the inflator bracket by the bracket bolts.
- Make sure that the side curtain airbag inflator retainer is installed properly. Otherwise the airbag could incorrectly deploy and cause damage or injuries.

1. Place the new side curtain airbag assembly on the side of the roof. Tighten the side curtain airbag mounting bolts (A) and mounting bolts (B).

Fig. 210: Identifying Side Curtain Airbag Mounting Bolts And Mounting Bolts With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Route the side curtain airbag tab (A) through the rear grab handle bracket (B) and over the top, and hook the tab onto the bracket's arrow tab (C).

Fig. 211: Identifying Side Curtain Airbag Tab And Rear Grab Handle Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Connect the side curtain airbag 2P connector (A) to the floor wire harness.

Left side shown; right side is similar.

Fig. 212: Identifying Side Curtain Airbag 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Left side shown; right side is similar.

4. Reconnect the negative cable to the battery.
5. Connect the HDS, and clear the DTCs (see **CLEAR THE DTC MEMORY WITH THE HDS**).
6. After installing the side curtain airbag, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
7. Install all removed parts.

8. Confirm proper headliner/pillar trim overlap (see **CHECKING AND ADJUSTING THE HEADLINER/PILLAR TRIM OVERLAP**).

AIRBAG AND TENSIONER DISPOSAL

Special Tools Required

Deployment tool 07HAZ-SG00500

Before scrapping any airbags, side airbags, side curtain airbags, seat belt tensioners, or lap belt tensioner (including those in a whole vehicle to be scrapped), the part(s) must be deployed. If the vehicle is still within the warranty period, the Acura District Parts and Service Manager must give approval and/or special instruction before deploying the part(s). Only after the part(s) have been deployed (as the result of vehicle collision, for example), can they be scrapped.

If the parts appear intact (not deployed), treat them with extreme caution. Follow this procedure.

DEPLOYING AIRBAGS IN THE VEHICLE

If an SRS equipped vehicle is to be entirely scrapped, its airbags, side airbags, side curtain airbags, and seat belt tensioners should be deployed while still in the vehicle. These parts should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the ignition switch OFF, then disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Confirm that each airbag, side airbag, side curtain airbag, or seat belt tensioner is securely mounted.
3. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

Driver's Airbag

4. Remove the access panel (A) from the steering wheel then disconnect the driver's airbag 4P connector (B) from the cable reel.

Fig. 213: Identifying Access Panel And Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Passenger's Airbag

5. Remove the glove box, then disconnect the front passenger's airbag 4P connector (A) from the dashboard wire harness.

Fig. 214: Identifying Front Passenger'S Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Airbag

6. Disconnect the side airbag 2P connector (A) from the floor wire harness.

Fig. 215: Identifying Side Airbag 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Curtain Airbag

7. Disconnect the floor wire harness 2P connector (A) from the side curtain airbag.

Fig. 216: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Seat Belt Tensioner

8. Disconnect the floor wire harness 4P connector (A) from the seat belt tensioner. Pull the seat belt out all the way and cut it.

Fig. 217: Identifying Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Cut off each connector, and strip the ends of the wires. Twist each pair of unlike colored wires together, and clip an alligator clip (A) from the deployment tool to each pair. Place the deployment tool at least 30 feet (10 meters) away from the vehicle.

NOTE: The driver's and front passenger's airbags have dual inflators. Twist each pair of unlike colored wires together, and clip an alligator clip to each pair.

Fig. 218: Identifying Alligator Clip (1 Of 2)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fig. 219: Identifying Alligator Clip (2 Of 2)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Connects 12 volt battery to the tool.
 - If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to **DISPOSAL OF DAMAGED COMPONENTS**.
 - If the red light on the tool comes on, the component is ready to be deployed.
11. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).
 - If the components deploy and the green light on the tool comes on, continue with this procedure.
 - If a component does not deploy, and the green light comes ON, its igniter is defective. Go to

DISPOSAL OF DAMAGED COMPONENTS.

- During deployment, the airbags can become hot enough to burn you. Wait 30 minutes after deployment before touching the airbags.
12. Dispose of the complete airbag. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.

Fig. 220: Identifying Airbag In Sturdy Plastic Bag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DEPLOYING COMPONENTS OUT OF THE VEHICLE

If an intact airbag or tensioner has been removed from a scrapped vehicle, or has been found defective or damaged during transit, storage, or service, it should be deployed as follows:

Fig. 221: Identifying Airbag Or Tensioner Deploying
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Confirm that the deployment tool is functioning properly by following the check procedure Deploying Airbags in the Vehicle on the tool label.
2. Position the airbag face up, outdoors, on flat ground, at least 30 feet (10 meters) from any obstacles or people.
3. Follow steps 9 through 12 of the in-vehicle deployment procedure.

NOTE: The driver's and front passenger's airbags have dual inflators. Twist each pair of unlike colored wires together, and clip an alligator clip to each pair.

DISPOSAL OF DAMAGED COMPONENTS

1. If installed in a vehicle, follow the removal procedure for the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**), side airbag (see **SIDE AIRBAG REPLACEMENT**), side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), and seat belt tensioner (see **FRONT SEAT BELT REPLACEMENT**).
2. In all cases, make a short circuit by cutting, stripping, and twisting together the two inflator wires.

NOTE: The driver's and front passenger's airbags have dual inflators. The like color wires go to the individual inflators. Twist the like colored wires together.

3. Package the component in exactly the same packaging that the new replacement part came in.
4. Mark the outside of the box "DAMAGED AIRBAG NOT DEPLOYED," "DAMAGED SIDE AIRBAG NOT DEPLOYED," "DAMAGED SIDE CURTAIN AIRBAG NOT DEPLOYED," "DAMAGED SEAT BELT TENSIONER NOT DEPLOYED" so it does not get confused with your parts stock.
5. Contact your Acura District Parts and Service Manager for instructions on how and where to return it for disposal.

DEPLOYMENT TOOL CHECK

1. Connect the yellow clips to both switch protector handles on the tool.
2. Then connect the red lead to the positive battery post and the black lead to the negative battery post.
3. Push the operation switch: The green light should come on, indicating that the tool is operating properly and is ready for use. If the red light stays on, the tool is faulty, and another one must be used for the procedure.
4. Disconnect the tool clips and connectors from the protector handles and the battery.

CABLE REEL REPLACEMENT

REMOVAL

1. Make sure the front wheels are aligned straight ahead.
2. Disconnect the negative cable from the battery, then wait for 3 minutes.
3. Remove the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).
4. Disconnect the connector (A) from the cable reel, then remove the steering wheel bolt (B).

Fig. 222: Identifying Connector And Steering Wheel Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Confirm that the front wheels point straight ahead, then remove the steering wheel with a steering wheel puller (see step 6 **STEERING WHEEL REMOVAL**). Do not tap on the steering wheel or steering column shaft when removing the steering wheel.
6. Remove the column cover screws (A), then remove the column covers (B, C).

Fig. 223: Identifying Column Cover Screws And Column Covers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector (B), then disconnect the dashboard wire harness 20P connector (C) from the cable reel (D).

Fig. 224: Identifying Dashboard Wire Harness 4P Connector, Cable Reel 4P Connector And Dashboard Wire Harness 20P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Release the lock tab (A) under the cable reel connector with a 90° hook shaped tool (B). Slide the tool below the cable reel connector just above the lock tab. Release the lower lock tab (C), and slide the cable reel off the column.

Fig. 225: Identifying Lock Tab Under Cable Reel Connector With 90° Hook Shaped Tool

Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Before installing the steering wheel, align the front wheels straight ahead.

2. If not already done, disconnect the negative cable from the battery, then wait for 3 minutes.
3. Set the turn signal canceling sleeve (A) so that the projections (B) are aligned vertically.

Fig. 226: Identifying Turn Signal Canceling Sleeve So That Projections Are Aligned Vertically
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Carefully install the cable reel (A) on the steering column shaft. Then connect 13P or 5P connector (B) to the cable reel, and connect the 4P connector (C) to the dashboard wire harness 4P connector (D).

Fig. 227: Identifying Cable Reel, 13P Or 5P Connector, 4P Connector And Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the steering column covers.
6. If necessary, center the cable reel (New replacement cable reels come centered.). Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise (about three turns) until the arrow mark (A) on the cable reel label points straight up.

Fig. 228: Identifying Arrow Mark On Cable Reel

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Position the two tabs (A) of the turn signal canceling sleeve (B) as shown, and install the steering wheel on to the steering column shaft, making sure the steering wheel hub (C) engages the pins (D) of the cable reel and tabs of the turn signal canceling sleeve. Do not tap on the steering wheel or steering column shaft when installing the steering wheel.

Fig. 229: Identifying Tabs And Turn Signal Canceling Sleeve

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install and torque a new steering wheel bolt (A), then reconnect the connectors.

Fig. 230: Identifying Steering Wheel Bolt With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).
10. Reconnect the negative cable to the battery.
11. After installing the cable reel, confirm proper system operation:
 - Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
 - After the SRS indicator has turned off, turn the steering wheel fully left and right to confirm the SRS indicator does not come on.
 - Make sure the horn works.
 - Make sure the cruise control buttons work.
 - Make sure the steering wheel audio controls work.
 - Make sure the INFO/SEL buttons works.

SRS UNIT REPLACEMENT

REMOVAL

NOTE: If you are only disconnecting SRS unit connector A, skip step 2.

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect both seat belt tensioner connectors (see step 7).
3. Remove the driver's center console trim (see step 5 on **CENTER CONSOLE REMOVAL/INSTALLATION**) and passenger's center console trim (see step 6 on **CENTER CONSOLE REMOVAL/INSTALLATION**).
4. Disconnect SRS unit connector A, connector B, connector C, and remove the TORX bolts (D), then pull out the SRS unit.

Fig. 231: Identifying SRS Unit Connector A, Connector B, Connector C, And TORX Bolts
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Install the new SRS unit (A) with new TORX bolts (B), then connect the connectors (C) to the SRS unit; push them into position until they click.

NOTE: Be sure the SRS unit is sitting squarely against its bracket before torquing the TORX bolt.

Fig. 232: Identifying SRS Unit, Torx Bolts And Connectors With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect both seat belt tensioner connectors (see step 8).
3. Reconnect the negative cable to the battery.
4. Calibrate the ODS unit (see **ODS UNIT CALIBRATION**).
5. Do the ODS unit operation check (see **ODS UNIT OPERATION CHECK**).

6. After installing the SRS unit, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
7. Reinstall all removed parts.

SIDE IMPACT SENSOR (FIRST) REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect the appropriate side airbag 2P connector (see step 4).
3. Remove the front seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**).
4. Remove the lower B-pillar lower trim panel (see **B-PILLAR UPPER/LOWER TRIM**).
5. Disconnect the floor wire harness 2P connector from the side impact sensor (first).
6. Using a TORX T30 bit, remove the TORX bolt (A), then remove the side impact sensor (first) (B).

Fig. 233: Identifying TORX Bolt And Side Impact Sensor (First)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Install the new side impact sensor (first) with the TORX bolt (A), then connect the floor wire harness 2P connector (B) to the side impact sensor (first).

Fig. 234: Identifying TORX Bolt And Floor Wire Harness 2P Connector With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect the negative cable to the battery.
3. After installing the side impact sensor (first) confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
4. Reinstall all removed parts.

SIDE IMPACT SENSOR (SECOND) REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect the appropriate side curtain airbag 2P connector (see step 5).
3. Remove the rear side trim panel (see TRIM REMOVAL/INSTALLATION - REAR SIDE AREA).
4. Disconnect the floor wire harness 2P connector from the side impact sensor (second).
5. Using a TORX f 30 bit, remove the TORX bolt (A) then remove the side impact sensor (second) (B).

Fig. 235: Identifying TORX Bolt And Side Impact Sensor (Second)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Install the new side impact sensor (second) with the TORX bolt (A) then connect floor wire harness 2P connector (B) to the side impact sensor (second).

Fig. 236: Identifying TORX Bolt And Floor Wire Harness 2P Connector With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect the negative cable to the battery.
3. After installing the side impact sensor (second), confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
4. Reinstall all removed parts.

ROLL RATE SENSOR REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect both side curtain airbag 2P connectors (see step 6).
3. Remove the second row seat (see **SECOND ROW SEAT REMOVAL/INSTALLATION**).
4. Disconnect the floor wire harness 2P connector (A) from the roll rate sensor.

Fig. 237: Identifying Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using a TORX T30 bit, remove the TORX bolt (B) then remove the roll rate sensor (C).

INSTALLATION

1. Install the new roll rate sensor with the TORX bolts (A) then connect the floor wire harness 2P connector (B) to the roll rate sensor (C).

Fig. 238: Identifying Floor Wire Harness 2P Connector With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect the negative cable to the battery.
3. Reinstall all removed parts.
4. After installing the roll rate sensor, confirm proper system operation: Turn the ignition switch to ON (II); the SRS indicator should come on for about 6 seconds and then go off.

REAR SAFING SENSOR REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect both side curtain airbag 2P connectors (see step 5).
3. Remove the second row seat (see **SECOND ROW SEAT REMOVAL/INSTALLATION**).
4. Disconnect the floor wire harness 4P connector (A) from the rear safing sensor.

Fig. 239: Identifying Floor Wire Harness 4P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the TORX bolt (B) using a TORX T30 bit, then remove the rear safing sensor (C).

INSTALLATION

1. Install the new rear safing sensor with the TORX bolt (A) then connect the floor wire harness 4P connector (B) to the rear safing sensor (C).

Fig. 240: Identifying Floor Wire Harness 4P Connector With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect the negative cable to the battery.
3. After installing the rear safing sensor, confirm proper system operation: Turn the ignition switch ON (II): the SRS indicator should come on for about 6 seconds and then go off.
4. Install all removed parts.

FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT

REMOVAL

NOTE:

- Removal of the front passenger's weight sensors must be done according to Precautions and Procedures (see PRECAUTIONS AND PROCEDURES).
- The front passenger's weight sensors are part of the slide/up-down adjuster and must be replaced as an assembly.

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Remove the front passenger's seat assembly (see FRONT SEAT REMOVAL/INSTALLATION).
3. Remove the front cover, recline cover, and center cover (see FRONT SEAT DISASSEMBLY/REASSEMBLY).
4. Disconnect the sensor connector's (A) from the ODS unit harness, then remove the mounting nuts (B) and mounting bolts (C) from weight sensors (D).

Fig. 241: Identifying Sensor Connector's, Mounting Nuts And Weight Sensors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the sensor connectors (D) from the ODS unit harness, then remove the front passenger's weight sensors.

INSTALLATION**NOTE:**

Be sure to install the harness wires so they are not pinched or interfere with other parts.

1. Install and torque the new front passenger's weight sensors with mounting nuts (A) and new mounting bolts (B) under the seat cushion.

Fig. 242: Identifying Front Passenger's Weight Sensors Mounting Nuts And Mounting Bolts Under Seat Cushion

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reinstall the front passenger's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
3. Reconnect the negative cable to the battery.
4. Calibrate the ODS unit (see **ODS UNIT CALIBRATION**).
5. After installing the front passenger's weight sensors, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come ON for about 6 seconds and then go off.

ODS UNIT REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect the passenger's side airbag harness 2P connector (see step 4).
3. Remove the passenger's seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**) and seat-back cover (see **FRONT SEAT-BACK COVER REPLACEMENT**).
4. Remove the cover (A), then disconnect the ODS unit 18P connector (B) and sensor connectors (C) from the ODS unit (D).

Fig. 243: Identifying Cover, ODS Unit 18P Connector And Sensor Connectors
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the two screws (E) and the ODS unit.

INSTALLATION

1. Place the new ODS unit (A) on the seat-back frame. Tighten the two screws (B), and connect the ODS unit harness 18P connector (C) and sensor connectors (D) to the ODS unit. Reinstall the cover (E).

Fig. 244: Identifying ODS Unit Harness 18P Connector And Sensor Connectors
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the seat-back cover in the reverse order of removal (see **FRONT SEAT-BACK COVER REPLACEMENT**).
3. Install the seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**), then connect the side airbag harness 2P connector.
4. Reconnect the negative cable to the battery.
5. Set the seat-back in the normal position, and make sure there is nothing on the front passenger's seat.
6. Initialize the ODS unit (see **ODS UNIT INITIALIZATION**).

7. After installing the ODS unit, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.

FRONT IMPACT SENSOR REPLACEMENT

REMOVAL

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect the driver's airbag 4P connector (see step 2), the front passenger's airbag 4P connector (see step 3), and both seat belt tensioner 4P connectors (see step 7).
3. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
4. Disconnect the left or right engine compartment wire harness 2P connector (A). Using a TORX T30 bit, remove the TORX bolts (B), then remove the front impact sensor (C).

Fig. 245: Identifying Engine Compartment Wire Harness 2P Connector, TORX Bolts And Front Impact Sensor

Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Install the new front impact sensor with a new TORX bolts (A), then connect the left or right engine compartment wire harness 2P connector (B) to the front impact sensor (C).

Fig. 246: Identifying Engine Compartment Wire Harness 2P Connector,TORX Bolts And Front Impact Sensor With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect the negative cable to the battery.
3. After installing the front impact sensor, confirm proper system operation: Turn the ignition switch ON (II); the SRS indicator should come on for about 6 seconds and then go off.
4. Reinstall all removed parts.

DRIVER'S SEAT POSITION SENSOR REPLACEMENT

REMOVAL

NOTE:

- Removal of the driver's seat position sensor must be done according to Precautions and Procedures (see **PRECAUTIONS AND PROCEDURES**).
- Do not turn the ignition switch ON (II), and do not connect the battery cable while removing the driver's seat position sensor.

1. Disconnect the negative cable from the battery, then wait for 3 minutes before starting work.
2. Disconnect the driver's airbag 4P connector (see step 2).
3. Remove the driver's seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**).
4. Disconnect the driver's seat wire harness 2P connector (A) from the driver's seat position sensor.

Fig. 247: Identifying Driver's Seat Wire Harness 2P Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Using a TORX T30 bit, remove the TORX bolt (B), then remove the driver's seat position sensor.

INSTALLATION

NOTE:

- Be sure to install the harness so it does not pinched or interfere with other parts.
- Do not turn the ignition switch ON (II), and do not connect the battery cable while installing the driver's seat position sensor.
- After installing the driver's seat position sensor, make sure it is clean. Keep it away from dust.

1. Install the new driver's seat position sensor with a TORX bolt (A), then connect the driver's seat wire harness 2P connector to the driver's seat position sensor (B).

Fig. 248: Identifying Driver's Seat Wire Harness 2P Connector With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Reconnect the driver's airbag 4P connector (see step 2).
3. Install the driver's seat assembly (see **FRONT SEAT REMOVAL/INSTALLATION**).

4. Reconnect the negative cable to the battery.
5. Check the operation of the driver's seat position sensor with the HDS (see **DRIVER'S SEAT POSITION SENSOR OPERATION CHECK**).

PASSENGER'S AIRBAG CUTOFF INDICATOR ILLUMINATION BULB TEST/REPLACEMENT

1. Remove the dashboard center panel (see **DASHBOARD CENTER PANEL REMOVAL/ INSTALLATION**).
2. Disconnect the 6P connector (A) from the passenger's airbag cutoff indicator (B).

Fig. 249: Identifying 6P Connector And Passenger's Airbag Cutoff Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Push out the passenger's airbag cutoff indicator from behind the center panel (C).
4. Check for continuity between the No. 3 and No. 4 terminals of the indicator. If there is no continuity, replace the bulbs (D).

NOTE: Both illumination bulbs are connected in parallel. If there is continuity, remove the lower, hazard switch illumination bulb, and recheck for continuity. If there is no continuity, replace the upper, passenger's airbag cutoff indicator illumination bulb.

5. Reinstall the parts in the reverse order of removal.

2007-09 BRAKES

VSA (Vehicle Stability Assist) System Components - MDX

COMPONENT LOCATION INDEX

Fig. 1: Identifying VSA Components Location

Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

SYSTEM INDICATOR

This system has four indicators and one warning:

- ABS indicator (A)
- Brake system indicator (B)
- VSA indicator (C)
- VSA activation indicator (D)

lost.

ABS, VSA Indicators, and Trailer Stability Assist Warning go off

Each indicator or warning will go off after a problem goes away, but the timing which the VSA modulator-control unit turns off the indicators or warning varies between DTCs.

- DTC 61,62:

The indicators go off automatically when the system returns to normal.

- DTC 11, 13, 15, 17, 21*, 22, 25, 26, 27, 31, 32, 33, 34, 35, 36, 37, 38, 45, 46, 47, 48, 54, 59, 65, 66, 67, 68, 69, 72, 73, 74, 75, 76, 81, 84, 91, 92, or 97* *:

The indicators stay on until the ignition switch is turned to LOCK (0) whether or not the system returns to normal.

* : There are some cases that the indicators stay on until the vehicle is driven after the system returns to normal.

* * : There are some cases that the indicators go off automatically when the system returns to normal.

- DTC 12, 14, 16, 18, 51, 52, or 53:

The indicators stay on until the vehicle is driven after the system returns to normal.

DIAGNOSTIC TROUBLE CODE (DTC)

- The memory can hold up to 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in the order they occur.
- The DTCs are memorized in the EEPROM. Therefore, the memorized DTCs cannot be erased by disconnecting the battery. Do the specified procedures to clear the DTCs.

Self-diagnosis

- Self-diagnosis can be classified into two categories:
 - Initial diagnosis: Done right after the ignition switch is turned to ON (II) and until the ABS and VSA indicators go off.
 - Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned to LOCK (0).
- When the system detects a problem, the VSA modulator-control unit shifts to the fail-safe mode.

Kickback

The pump motor operates When the VSA modulator-control unit is functioning, and the fluid in the reservoir is forced out to the master cylinder, causing a kickback at the brake pedal.

Pump Motor

- The pump motor operates when the VSA modulator-control unit is functioning.
- The VSA modulator-control unit checks the pump motor operation one time after completing initial diagnosis during regular when the vehicle is driven over 10 mph (15 km/h) and at 19 mph (30 km/h).

Brake Fluid Replacement/Air Bleeding

Brake fluid replacement and air bleeding procedures are identical to the procedures used on vehicles without the VSA system (see **BRAKE SYSTEM BLEEDING**).

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the ABS, VSA indicators, and/or trailer stability assist warning are still on. Following a troubleshooting procedure for a code that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the client about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the ABS, VSA indicators, and/or trailer stability assist warning came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the client demonstrate the concern.
2. When the ABS, VSA indicators, or trailer stability assist warning does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. before you start troubleshooting.
3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the ABS, VSA indicators, and trailer stability assist warning do not come on.
4. Check for DTCs from other systems which connected via F-CAN. If there are DTCs that are related to F-CAN, the most likely cause was that the ignition switch was turned to ON (II) with the VSA modulator-control unit connector disconnected. Clear the DTCs. Check for fuel and emissions codes, first. Be sure to troubleshoot those first.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If the indicator(s) of the system does not come on, check for loose connectors or poor contacts in the terminals related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

1. If the system indicators stay on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

Fig. 3: Identifying Data Link Connector (DLC)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated **DTC'S TROUBLESHOOTING**, and do the appropriate troubleshooting procedure.

NOTE:

- The HDS can read the DTC, the current data, and other system data.
- For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

1. With the ignition switch at LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the **DTCS TROUBLESHOOTING**.
5. Turn the ignition switch to LOCK (0).

How to Clear DTCs

1. With the ignition switch at LOCK (0), connect the HDS to the data link connector (DLC) under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

4. Clear the DTC(s) by following the screen prompts on the HDS.
5. Turn the ignition switch to LOCK (0).

System Outline

This system is composed of the VSA modulator-control unit, the wheel speed sensors, the steering angle sensor, and the yaw rate-lateral/longitudinal acceleration sensor, and the system indicators in the gauge control module. The VSA modulator-control unit controls the ABS, EBD, TCS, VSA, trailer stability assist, and brake assist with the brake pressure of each wheel and the engine torque.

Fig. 6: Control Unit And Modulator Unit System Diagram
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

ABS Features

Anti-lock control

Without ABS, when the brake pedal is pressed while driving, the wheels sometimes lock before the vehicle comes to a stop. In such an event, the maneuverability of the vehicle is reduced if the front wheels are locked,

and the stability of the vehicle is reduced if the rear wheels are locked, creating an extremely unstable condition. With ABS, the system precisely controls the slip rate of the wheels to ensure maximum grip force from the tires, and it thereby ensures maneuverability and stability of the vehicle. The ABS calculates the slip rate of the wheels based on the four wheel speeds, and then it controls the brake fluid pressure to reach the target slip rate.

Grip force of tire and road surface

Fig. 7: Friction And Slip Rate Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Main Control

The control unit detects the wheel speed based on the wheel speed sensor signals it receives, then it calculates the vehicle speed based on the detected wheel speed. The control unit detects the vehicle speed during deceleration based on the wheel speeds.

The control unit calculates the slip rate of each wheel, and transmits the control signal to the modulator unit solenoid valve when the slip rate is high.

The hydraulic control has three modes: Pressure intensifying, pressure reducing, and pressure retaining.

Fig. 8: Control Unit Flow Diagram

Courtesy of AMERICAN HONDA MOTOR CO., INC.

EBD Features

The electronic brake distribution (EBD) feature helps control vehicle braking by adjusting the rear brake force in accordance with the rear wheel load before the ABS operates. Based on the wheel speed sensor signals, the control unit uses the modulator to control the rear brakes individually. When the rear wheel speed is less than the front wheel speed, the VSA modulator-control unit retains the current rear brake fluid pressure by closing the inlet valve in the modulator. As the rear wheel speed increases and approaches the front wheel speed, the VSA modulator-control unit increases the rear brake fluid pressure by momentarily opening the inlet valve. This whole process is repeated very rapidly. While this is happening, kickback may be felt at the brake pedal.

**Fig. 9: Brake Pressure And Wheel Pressure Graph**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

TCS Features

When a drive wheel loses traction on a slippery road surface and starts to spin, the VSA modulator-control unit applies brake pressure to the spinning wheel and sends an engine torque control request to the PCM to slow the spinning wheel and keep traction.

Fig. 10: TCS Features Diagram

Courtesy of AMERICAN HONDA MOTOR CO., INC.

VSA System Features

Oversteer control

Applies the brake to the front and rear outside wheels

Fig. 11: Identifying Yaw Rate Turning Direction (Oversteer Control)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Understeer control

- Applies the brake to the rear inside wheel

- Controls the engine torque when accelerating

Fig. 12: Identifying Yaw Rate Turning Direction (Understeer Control)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Brake Assist Features

Brake assist helps ensure that any driver can achieve the full braking potential of the vehicle by increasing brake system pressure in a panic situation, bringing the vehicle into a full ABS stop.

If during a panic stop the VSA modulator-control unit determines that the brake system pressure increases above a threshold in less than a certain amount of time, the VSA modulator-control unit engages brake assist.

Because the brake system pressure crossed the pressure threshold before the time threshold had expired, the VSA modulator-control unit goes into brake assist mode.

Fig. 13: Time And Pressure Graph

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Modulator Unit

The modulator unit consists of the inlet solenoid valve, the outlet solenoid valve, the VSA NO (normally open) solenoid valve, the VSA NC (normally closed) solenoid valve, the reservoir, the pump, the pump motor, and the damping chamber.

The hydraulic control has three modes of ABS action; pressure intensifying, pressure retaining, and pressure reducing.

Pressure intensifying mode (VSA) is a combination of the TCS, VSA, and brake assist action.

The hydraulic circuit is an independent four channel type; one channel for each wheel.

Fig. 14: Modulator Unit Diagram

Courtesy of AMERICAN HONDA MOTOR CO., INC.

BRAKE FLUID SPECIFICATION

Mode	VSA NO Valve	VSA NC Valve	Inlet Solenoid Valve	Outlet Solenoid Valve	Brake Fluid
Pressure intensifying mode	open	closed	open	closed	Master cylinder fluid is pumped out to the caliper.
Pressure retaining mode	open	closed	closed	closed	Caliper fluid is retained by the inlet and outlet valves.
Pressure reducing mode	open	closed	closed	open	- Caliper fluid flows through the outlet valve to the reservoir. - The motor pumps the reservoir fluid through the damping chamber to the master cylinder (1).
					Master cylinder fluid is pumped

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

Pressure intensifying mode (VSA)	closed	open	open	closed	out by pump with motor through VSA NC valve to the caliper. • Caliper fluid pressure exceeds master cylinder pressure.
(1) The motor will continue running until the operation of the one anti-lock brake control is finished with the first pressure reducing mode.					

Trailer Stability Assist Features

While towing a trailer, factors, such as a lane change, inappropriate tongue weight, and crosswind, can cause trailer sway. This may also cause the vehicle to sway. The trailer stability assist helps stabilize the vehicle, using the same system as VSA (VSA modulator-control unit and sensors). With signals from each sensor, the trailer stability assist detects when trailer sway affects the vehicle, and then reduces vehicle speed while stabilizing the vehicle. The rear brake lights automatically turn on when the trailer stability assist activates.

DTC TROUBLESHOOTING

DTC 11, 13, 15, 17: WHEEL SPEED SENSOR (OPEN/SHORT TO BODY GROUND/SHORT TO

POWER)

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 22 indicated with DTC 11, 13, 15, and/or 17 at the same time?

YES -Go to step 9.

NO -Go to step 3.

3. Clear the DTC with the HDS.
4. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
5. Check for DTCs with the HDS.

Is DTC 11, 13, 15, and/or 17 indicated?

YES -Go to step 6.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

6. Turn the ignition switch to LOCK (0).
7. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 46P connector.

Are their connections OK?

YES -Go to step 8.

NO -Reconnect the connector and retest.

8. Check that the appropriate wheel speed sensor is properly mounted (see **WHEEL SPEED SENSOR REPLACEMENT**).

DTC REFERENCE

DTC	Appropriate Wheel Speed Sensor
11	Right-front
13	Left-front
15	Right-rear
17	Left-rear

Is the wheel speed sensor installation OK?

YES -Go to step 10.

NO -Reinstall the wheel speed sensor, and check the mounting position (see **WHEEL SPEED SENSOR REPLACEMENT**).

9. Turn the ignition switch to LOCK (0).
10. Disconnect the VSA modulator-control unit 46P connector.
11. Start the engine.
12. Measure the voltage between body ground and the appropriate wheel speed sensor +B and GND terminals of the VSA modulator-control unit 46P connector individually (see table **TERMINAL REFERENCE**).

TERMINAL REFERENCE

DTC	Appropriate Terminal	
	+B	GND

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Fig. 19: Measuring Voltage Between Body Ground And VSA Modulator-Control Unit 46P Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.1 V or more?

YES -Repair short to power in the wire between the VSA modulator-control unit and the appropriate wheel speed sensor.

NO -Go to step 13.

13. Turn the ignition switch to LOCK (0).
14. Check for continuity between body ground and the appropriate wheel speed sensor +B and GND terminals of the VSA modulator-control unit 46P connector individually (see table **TERMINAL REFERENCE**).

TERMINAL REFERENCE

DTC	Appropriate Terminal	
	+B	GND

Is there continuity in both directions?

YES -Repair short in the wires between the VSA modulator-control unit and the appropriate wheel speed sensor.

NO -Replace the appropriate wheel speed sensor (see **WHEEL SPEED SENSOR REPLACEMENT**).

DTC 12,14,16,18: WHEEL SPEED SENSOR (ELECTRICAL NOISE/INTERMITTENT INTERRUPTION)

NOTE:

- If the ABS and other indicators come on because of electrical noise, the indicators will go off when you test-drive the vehicle speed at 10 mph (15 km/h) or more and the noise is gone.
- An incorrectly installed wheel bearing can cause one of these DTCs.

1. Turn the ignition switch to LOCK (0).
2. Check the appropriate wheel speed sensor and inspect the magnetic encoder on the appropriate hub bearing for debris: Front (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**), rear (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).

TERMINAL REFERENCE

DTC	Appropriate Wheel Speed Sensor and Magnetic Encoder
12	Right-front
14	Left-front
16	Right-rear
18	Left-rear

Are they installed correctly in good condition, and free of debris?

YES -Go to step 3.

NO -Reinstall or replace the appropriate wheel speed sensor, hub bearing unit, and retest by test-driving.

3. Substitute an appropriate known-good wheel speed sensor (see **WHEEL SPEED SENSOR REPLACEMENT**).
4. Turn the ignition switch to ON (II).
5. Clear the DTC with the HDS.
6. Test-drive the vehicle at 10 mph (15 km/h) or more.
7. Check for DTCs with the HDS.

Is DTC 12, 14, 16, and/or 18 indicated?

YES -Go to step 8.

NO -Replace the original wheel speed sensor (see **WHEEL SPEED SENSOR REPLACEMENT**).

8. Turn the ignition switch to LOCK (0).
9. Substitute an appropriate known-good hub bearing unit: Front (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**), rear (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).
10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Test-drive the vehicle at 10 mph (15 km/h) or more.
13. Check for DTCs with the HDS.

Is DTC 12, 14, 16, and/or 18 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Replace the original hub bearing unit:

- Front: Replace the original front hub bearing unit (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).
- Rear: Replace the original rear hub bearing unit (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).

DTC 21: DIFFERENCE IN WHEEL SPEED

NOTE: **A wheel bearing that is installed backwards can cause this DTC.**

1. Check all four tires for size, inflation, and wear.

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

Are all four tires the correct size, properly inflated, and worn evenly?

YES -Go to step 2.

NO -Install the correct tires, a known-good set of tires, or set the tires to the correct pressure, and retest by test-driving.

2. Test-drive the vehicle.
3. Check the RF, LF, RR, LR WHEEL SPD in the VSA DATA LIST with the HDS.

Are all four the same indicated value?

YES -Go to step 4.

NO -Reinstall or replace the wheel speed sensor(s) (see **WHEEL SPEED SENSOR REPLACEMENT**), and retest by test-driving.

4. Check all magnetic encoders on the hub bearing units: Front (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**), rear (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).

Are they installed correctly and in good condition?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Reinstall or replace the hub bearing unit(s), and retest by test-driving:

- Front: Reinstall or replace the front hub bearing unit (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).
- Rear: Reinstall or replace the rear hub bearing unit (see **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).

DTC 22: CURRENT FLOW INTO WHEEL SPEED SENSOR INPUT AMPLIFIER

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 22 indicated?

YES -Do the DTC 11, 13, 15, and/or 17 troubleshooting (see **DTC 11, 13, 15, 17: Wheel Speed Sensor (Open/Short to Body Ground/Short to Power)**).

NO -Intermittent failure, the system is OK at this time. Check for loose terminals between the wheel speed sensor 2P connector and the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** (see).

DTC 25: YAW RATE SENSOR (SENSOR UNIT); DTC 26: LATERAL/LONGITUDINAL ACCELERATION SENSOR (SENSOR UNIT)

NOTE: **These code(s) will set after a test drive if the sensor is installed incorrectly.**

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 91 or 92 indicated with DTC 25 or 26 at the same time?

YES -Do the DTC 91 or 92 troubleshooting: DTC 91 (see **DTC 91: F-CAN COMMUNICATION**), DTC 92 (see **DTC 92: F-CAN SYSTEM (BUS-OFF)**).

NO -Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Substitute a known-good yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).
5. Turn the ignition switch to ON (II).
6. Clear the DTC with the HDS.
7. Test-drive the vehicle. Drive the vehicle at 19 mph (30 km/h) or more, and go a distance of 985 ft (300 m) or more.
8. Check for DTCs with the HDS.

Is DTC 25 or 26 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Replace the original yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

DTC 27: STEERING ANGLE SENSOR (HARDWARE)

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 91 or 92 indicated with DTC 27 at the same time?

YES -Do the DTC 91 or 92 troubleshooting: DTC 91 (see **DTC 91: F-CAN COMMUNICATION**),

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

DTC 92 (see **DTC 92: F-CAN SYSTEM (BUS-OFF)**).

NO -Go to step 3.

3. Check the steering angle sensor installation (see **STEERING ANGLE SENSOR REPLACEMENT**).

Is the steering angle sensor installed correctly?

YES -Replace the steering angle sensor (see **STEERING ANGLE SENSOR REPLACEMENT**), then do the steering angle sensor center point writing (see **STEERING ANGLE SENSOR CENTER POINT WRITING**).

NO -Reinstall the steering angle sensor correctly (see **STEERING ANGLE SENSOR REPLACEMENT**), then do the steering angle sensor center point writing (see **STEERING ANGLE SENSOR CENTER POINT WRITING**).

DTC 31, 32, 33, 34, 35, 36, 37, 38: ABS SOLENOID

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 31, 32, 33, 34, 35, 36, 37, and/or 38 indicated?

YES -Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -Intermittent failure, the system is OK at this time. Check for a loose connection at G303.

DTC 45, 46, 47, 48: VSA SOLENOID

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 45, 46, 47, and/or 48 indicated?

YES -Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -Intermittent failure, the system is OK at this time. Check for a loose connection at G303.

DTC 51: MOTOR LOCKED

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle. Drive the vehicle at 10 mph (15 km/h) or more, with the engine speed at 2,500 rpm or higher.
4. Check for DTCs with the HDS.

Is DTC 51 indicated?

YES -Inspect G303 for loose or poor connection, then replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -Intermittent failure, the system is OK at this time. Check for a loose connection at G303.

DTC 52: MOTOR STUCK OFF

1. Turn the ignition switch to LOCK (0).
2. Check the No. 2 (40 A) fuse in the main under-hood fuse box.

Is the fuse blown?

YES -Go to step 3.

NO -Reinstall the checked fuse, then go to step 5.

3. Disconnect the VSA modulator-control unit 46P connector.
4. Check for continuity between VSA modulator-control unit 46P connector terminal No. 45 and body ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 26: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal No. 45 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the No. 2 (40 A) fuse in the main under-hood fuse

box and the VSA modulator-control unit.

NO -Install a new No. 2 (40 A) fuse, then go to step 7.

5. Disconnect the VSA modulator-control unit 46P connector.
6. Measure the voltage between VSA modulator-control unit 46P connector terminal No. 45 and body ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 27: Measuring Voltage Between VSA Modulator-Control Unit 46P Connector Terminal 45 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 7.

NO -Repair open in the wire between the No. 2 (40 A) fuse in the main under-hood fuse box and the VSA modulator-control unit.

7. Reconnect the VSA modulator-control unit 46P connector.
8. Turn the ignition switch to ON (II).
9. Clear the DTC with the HDS.
10. Test-drive the vehicle. Drive the vehicle at 10 mph (15 km/h) or more, with the engine speed at 2,500 rpm or higher.
11. Check for DTCs with the HDS.

Is DTC 52 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

DTC 53: MOTOR STUCK ON

1. Turn the ignition switch to ON (II).

Is the pump motor running?

YES -Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -Go to step 2.

2. Turn the ignition switch to LOCK (0).
3. Disconnect the VSA modulator-control unit 46P connector.
4. Check for continuity between VSA modulator-control unit 46P connector terminal No. 46 and body ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 28: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal 46 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 5.

NO -Repair open in the wire between the VSA modulator-control unit and body ground (G303).

5. Reconnect the VSA modulator-control unit 46P connector.
6. Turn the ignition switch to ON (II).
7. Clear the DTC with the HDS.
8. Test-drive the vehicle. Drive the vehicle at 10 mph (15 km/h) or more, with the engine speed at 2,500 rpm or higher.
9. Check for DTCs with the HDS.

Is DTC 53 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

DTC 54: VALVE RELAY

1. Turn the ignition switch to LOCK (0).
2. Check the No. 12 (20 A) fuse in the main under-hood fuse box.

Is the fuse blown?

YES -Go to step 3.

NO -Reinstall the checked fuse, then go to step 5.

3. Disconnect the VSA modulator-control unit 46P connector.
4. Check for continuity between VSA modulator-control unit 46P connector terminal No. 44 and body ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 29: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal 44 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the No. 12 (20 A) fuse in the main under-hood fuse box and the VSA modulator-control unit.

NO -Install a new No. 12 (20 A) fuse, then go to step 7.

5. Disconnect the VSA modulator-control unit 46P connector.
6. Measure the voltage between VSA modulator-control unit 46P connector terminal No. 44 and body

ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 30: Identifying Voltage Between VSA Modulator-Control Unit 46P Connector Terminal 44 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 7.

NO -Repair open in the wire between the No. 12 (20 A) fuse in the main under-hood fuse box and the VSA modulator-control unit.

7. Reconnect the VSA modulator-control unit 46P connector.
8. Turn the ignition switch to ON (II).
9. Clear the DTC with the HDS.
10. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
11. Check for DTCs with the HDS.

Is DTC 54 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

DTC 59: BRKDIAG HIGH

1. Turn the ignition switch to LOCK (0).
2. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

YES -Repair short to power in the brake light circuit.

NO -Go to step 3.

3. Turn the ignition switch to ON (II).
4. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES -Go to step 5.

NO -Go to step 9.

5. Turn the ignition switch to LOCK (0).
6. Disconnect the VSA modulator-control unit 46P connector.
7. Turn the ignition switch to ON (II).
8. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES -Go to step 9.

NO -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

9. Clear the DTC with the HDS.
10. Press the brake pedal for 3 seconds or more.
11. Check for DTCs with the HDS.

Is DTC 59 indicated

YES -Go to step 12.

NO -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

12. Turn the ignition switch to LOCK (0).
13. Disconnect the brake pedal position switch 4P connector.
14. Turn the ignition switch to ON (II).
15. Measure the voltage between the brake pedal position switch 4P connector terminal No. 2 and body ground with the headlights OFF and ON.

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR

Wire side of female terminals

Fig. 31: Identifying Voltage Between Brake Pedal Position Switch 4P Connector Terminal No. 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.5 V?

YES -Go to step 16.

NO -Disconnect the taillight assemblies one at a time and retest. If the voltage is OK, check the taillight ground connection and then replace the faulty taillight.

16. Turn the ignition switch to LOCK (0).
17. Short the SCS line with the HDS.
18. Disconnect the PCM connector A (49P).
19. Check for continuity between brake pedal position switch 4P connector terminal No. 2 and PCM connector A (49P) terminal No. 8.

PCM CONNECTOR A (49P)
Terminal side of female terminals

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR
Wire side of female terminals

Fig. 32: Identifying Continuity Between Brake Pedal Position Switch 4P Connector Terminal 2 And PCM Connector Terminal 8

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the PCM (see **PCM REPLACEMENT**).

NO -Repair open in the wire between the PCM and the brake pedal position switch.

DTC 61: IG1 VOLTAGE LOW

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle at 2 mph (3 km/h) or more.
4. Check for DTCs with the HDS.

Is DTC 61 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** (see).

5. Test the battery and connections.

Are the battery and battery connections OK?

YES -Check for a poor connection at all IG1 circuit connections between the VSA modulator-control unit 46P connector terminal No. 40 and the under-dash fuse/relay box No. 29 (10A) fuse. If the connections are good, go to the Alternator and Regulator Circuit Troubleshooting (see **ALTERNATOR AND REGULATOR CIRCUIT TROUBLESHOOTING**).

NO -Replace or charge the battery (see **BATTERY TEST**), or repair the connections.

DTC 62: IG1 VOLTAGE HIGH

NOTE: **An overcharging alternator can cause this DTC.**

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Test-drive the vehicle at 2 mph (3 km/h) or more.
4. Check for DTCs with the HDS.

Is DTC 62 indicated?

YES -Check for a poor connection at the battery terminals. Check for a loose connection at G303. If the connections are good, go to the Alternator and Regulator Circuit Troubleshooting (see **ALTERNATOR**

AND REGULATOR CIRCUIT TROUBLESHOOTING).

NO -Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

DTC 65: VSA PRESSURE SENSOR (HARDWARE)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 65 indicated?

YES -Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -Intermittent failure, the system is OK at this time. Check for a loose connection at G303.

DTC 66: VSA PRESSURE SENSOR (SOFTWARE)

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 91 or 92 indicated with DTC 66 at the same time?

YES -Do the DTC 91 or 92 troubleshooting: DTC 91 (see **DTC 91: F-CAN COMMUNICATION**), DTC 92 (see **DTC 92: F-CAN SYSTEM (BUS-OFF)**).

NO -Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Disconnect the brake pedal position switch 4P connector.
5. Do the brake pedal position switch test (see **BRAKE PEDAL POSITION SWITCH TEST**).

Is the switch OK?

YES -Go to step 6.

NO -Replace the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

6. Short the SCS line with the HDS.
7. Disconnect the PCM connector A (49P).

8. Turn the ignition switch to ON (II).
9. Measure the voltage between PCM connector A (49P) terminal No. 8 and body ground.

Fig. 33: Identifying Voltage Between PCM Connector A (49P) Terminal No. 8 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.1 V or more when the brake pedal is released?

YES -Repair short to power in the wire between the brake pedal position switch and the PCM.

NO -Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Substitute a known-good PCM (see **SUBSTITUTING THE PCM**).
12. Turn the ignition switch to ON (II).
13. Clear the DTC with the HDS.
14. Test-drive the vehicle at 8 mph (12 km/h) for 60 seconds or more.
15. Check for DTCs with the HDS.

Is DTC 66 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**), and retest.

NO -Replace the original PCM (see **PCM REPLACEMENT**).

DTC 67: BRAKE PEDAL POSITION SWITCH STUCK ON (HARDWARE)

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 91 or 92 indicated with DTC 67 at the same time?

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

YES -Do the DTC 91 or 92 troubleshooting: DTC 91 (see **DTC 91: F-CAN COMMUNICATION**), DTC 92 (see **DTC 92: F-CAN SYSTEM (BUS-OFF)**).

NO -Go to step 3.

3. Check the BRAKE SWITCH in the VSA DATA LIST with the HDS while moving the brake pedal.

Does it indicate ON when the pedal is pressed, and OFF when the pedal is released?

YES -Go to step 4.

NO -Go to step 7.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle at 10 mph (15 km/h) for 60 seconds or more.
6. Check for DTCs with the HDS.

Is DTC 67 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

7. Turn the ignition switch to LOCK (0).
8. Disconnect the brake pedal position switch 4P connector.
9. Do the brake pedal position switch test (see **BRAKE PEDAL POSITION SWITCH TEST**).

Is the switch OK?

YES -Check for fuel and emissions systems DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**), and troubleshoot those DTCs first, if no fuel and emissions systems DTCs are found troubleshoot the brake pedal position switch signal circuit (see **BRAKE PEDAL POSITION SWITCH SIGNAL CIRCUIT TROUBLESHOOTING**).

NO -Replace the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

DTC 68: BRAKE PEDAL POSITION SWITCH STUCK OFF (SOFTWARE)

1. Turn the ignition switch to LOCK (0).
2. Check the No. 11 (15 A) fuse in the main under-hood fuse box.

Is the fuse blown?

YES -Go to step 3.

NO -Reinstall the checked fuse, then go to step 14.

3. Short the SCS line with the HDS.
4. Disconnect the PCM connector A (49P).
5. Disconnect the brake pedal position switch 4P connector.
6. Remove the brake light relay.
7. Check for continuity between PCM connector A (49P) terminal No. 8 and body ground.

Fig. 34: Identifying Continuity Between PCM Connector A (49P) Terminal No. 8 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the PCM and the brake pedal position switch or the brake light relay.

NO -Go to step 8.

8. Check for continuity between brake pedal position switch 4P connector terminal No. 1 and body ground.

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR

Wire side of female terminals

Fig. 35: Identifying Continuity Between Brake Pedal Position Switch 4P Connector Terminal No. 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the No. 11 (15 A) fuse in the main under-hood fuse box and the brake pedal position switch or the brake light relay.

NO -Go to step 9.

9. Reconnect all connectors, and install the brake light relay.
10. Turn the ignition switch to ON (II).
11. Clear the DTC with the HDS.
12. Start the engine, then press the brake pedal slowly and hard.
13. Check for DTCs with the HDS.

Is DTC 68 indicated?

YES -Turn the ignition switch to LOCK (0), then go to step 20.

NO -The system is OK at this time.

14. Disconnect the brake pedal position switch 4P connector.
15. Measure the voltage between brake pedal position switch 4P connector terminal No. 1 and body ground.

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR

Wire side of female terminals

Fig. 36: Identifying Voltage Between Brake Pedal Position Switch 4P Connector Terminal No. 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 16.

NO -Repair open in the wire between the No. 11 (15 A) fuse in the main under-hood fuse box and the brake pedal position switch.

16. Short the SCS line with the HDS.
17. Disconnect the PCM connector A (49P).
18. Check for continuity between brake pedal position switch 4P connector terminal No. 2 and PCM connector A (49P) terminal No. 8.

PCM CONNECTOR A (49P)
Terminal side of female terminals

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR
Wire side of female terminals

Fig. 37: Identifying Continuity Between Brake Pedal Position Switch 4P Connector Terminal 2 And PCM Connector Terminal 8

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

Is there continuity?

YES -Go to step 19.

NO -Repair open in the wire between the PCM and the brake pedal position switch.

19. Reconnect all connectors.

20. Do the brake pedal position switch test (see **BRAKE PEDAL POSITION SWITCH TEST**).

Is the switch OK?

YES -Go to step 21.

NO -Replace the brake pedal position switch (see **BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT**).

21. Substitute a known-good PCM (see **SUBSTITUTING THE PCM**).

22. Turn the ignition switch to ON (II).

23. Clear the DTC with the HDS.

24. Start the engine, then press the brake pedal slowly and hard.

25. Check for DTCs with the HDS.

Is DTC 68 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Replace the original PCM (see **PCM REPLACEMENT**).

DTC 69: BRKDIAG LOW

1. Turn the ignition switch to ON (II).

2. Clear the DTC with the HDS.

3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.

4. After the VSA indicator goes off, press the brake pedal for 3 seconds or more.

5. Check for DTCs with the HDS.

Is DTC 69 indicated?

YES -Go to step 6.

NO -Go to step 19.

6. Turn the ignition switch to LOCK (0).
7. Remove the brake light relay.
8. Disconnect the brake pedal position switch 4P connector.
9. Check for continuity between the brake pedal position switch 4P connector terminal No. 2 and the brake light relay 5P connector terminal No. 4.

BRAKE PEDAL POSITION SWITCH 4P CONNECTOR

Wire side of female terminals

Fig. 38: Identifying Continuity Between Brake Pedal Position Switch 4P Connector Terminal And Brake Light Relay 5P Connector Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 10.

NO -Repair open in the wire between the brake pedal position switch and the brake light relay.

10. Disconnect the VSA modulator-control unit 46P connector.
11. Check for continuity between the VSA modulator-control unit 46P connector terminal No. 6 and the brake light relay 5P connector terminal No. 1.

Fig. 39: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal 6 And Brake Light Relay 5P Connector Terminal 1
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 12.

NO -Repair open in the wire between the VSA modulator-control unit and the brake light relay.

12. Substitute a known-good brake light relay.
13. Reconnect all connectors.
14. Turn the ignition switch to ON (II).
15. Clear the DTC with the HDS.
16. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
17. After the VSA indicator goes off, press the brake pedal for 3 seconds or more.
18. Check for DTCs with the HDS.

Is DTC 69 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Replace the original brake light relay.

19. Turn the ignition switch to LOCK (0).
20. Disconnect the VSA modulator-control unit 46P connector.
21. Turn the ignition switch to ON (II).
22. Connect the VSA modulator-control unit 46P connector terminal Mo. 37 to body ground with a jumper wire.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

JUMPER WIRE

Wire side of female terminals

Fig. 40: Identifying VSA Modulator-Control Unit 46P Connector Terminal 37 To Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES -Go to step 29.

NO -Go to step 24.

24. Turn the ignition switch to LOCK (0).

25. Remove the brake light relay.

26. Check for continuity between the VSA modulator-control unit 46P connector terminal No. 37 and the brake light relay 5P connector terminal No. 3.

Fig. 41: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal 37 And Connector Terminal 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 27.

NO -Repair open in the wire between the VSA modulator-control unit and the brake light relay.

27. Turn the ignition switch to ON (II).
28. Measure the voltage between brake light relay 5P connector terminal No. 5 and body ground.

BRAKE LIGHT RELAY 5P CONNECTOR

Terminal side of female terminals

Fig. 42: Identifying Voltage Between Brake Light Relay 5P Connector Terminal No. 5 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Replace the brake light relay.

NO -Repair open in the wire between the No. 20 (7.5 A) fuse in the under-dash fuse/relay box and the brake light relay.

29. Turn the ignition switch to LOCK (0).
30. Check for continuity between VSA modulator-control unit 46P connector terminal No. 6 and brake light relay 5P connector terminal No. 1.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR
Wire side of female terminals

Fig. 43: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal 6 And Connector Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

Is there continuity?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary/ substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Repair open in the wire between the VSA modulator-control unit and the brake light relay.

DTC 72: STEERING ANGLE SENSOR (SOFTWARE)

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 91 or 92 indicated with DTC 72 at the same time?

YES -Do the DTC 91 or 92 troubleshooting: DTC 91 (see **DTC 91: F-CAN COMMUNICATION**), DTC 92 (see **DTC 92: F-CAN SYSTEM (BUS-OFF)**).

NO -Go to step 3.

3. Put the vehicle on a level surface, and center the steering wheel spokes.
4. Check STEERING ANGLE in the VSA DATA LIST with the HDS.

With the front wheels in the straight ahead position, is STEERING ANGLE $0^{\circ} \pm 5^{\circ}$?

YES -Go to step 5.

NO -Check the installation of the steering angle sensor (see **STEERING ANGLE SENSOR REPLACEMENT**). If installation is good, do the steering angle sensor center point writing (see **STEERING ANGLE SENSOR CENTER POINT WRITING**).

5. Check the wheel alignment (see **WHEEL ALIGNMENT**).

Is the wheel alignment within the specification?

YES -Go to step 6.

NO -Make sure the suspension is not modified, adjust the wheel alignment correctly, then go to step 6.

6. Turn the ignition switch to ON (II).
7. Clear the DTCs with the HDS.
8. Test-drive the vehicle around a number of corners.
9. Check for DTCs with the HDS.

Is DTC 72 indicated?

YES -Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -The system is OK at this time.

DTC 73: YAW RATE SENSOR (POWER SUPPLY)

1. Turn the ignition switch to LOCK (0).
2. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 4P connector.
3. Turn the ignition switch to ON (II).
4. Measure the voltage between body ground and yaw rate-lateral/longitudinal acceleration sensor 4P connector terminal No. 1.

**YAW RATE-LATERAL/LONGITUDINAL
ACCELERATION SENSOR 4P CONNECTOR**

Wire side of female terminals

Fig. 44: Identifying Voltage Between Body Ground And Yaw Rate-Lateral/Longitudinal Acceleration Sensor 4P Connector Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Replace the yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

NO -Repair open in the wire between the No. 29 (10 A) fuse in the under-dash fuse/relay box and the yaw rate-lateral/longitudinal acceleration sensor.

DTC 74: YAW RATE SENSOR (SOFTWARE)

NOTE: Driving on an extremely angled road can cause this DTC.

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 97 indicated with DTC 74 at the same time?

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

YES -Do the DTC 97 troubleshooting (see **DTC 97: VSA SYSTEM**).

NO -Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Check that the yaw rate-lateral/longitudinal acceleration sensor is properly mounted (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

Is the yaw rate-lateral/longitudinal acceleration sensor installation OK?

YES -Go to step 5.

NO -Reinstall the yaw rate-lateral/longitudinal acceleration sensor (see **STEERING ANGLE SENSOR CENTER POINT WRITING**), and retest by test-driving.

5. Put the vehicle on a level surface.
6. Turn the ignition switch to ON (II).
7. Check the YAW RATE S in the VSA DATA LIST with the HDS.

Is the YAW RATE $0^{\circ} \pm 5^{\circ}/s$?

YES -Go to step 8.

NO -Replace the yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

8. Clear the DTC with the HDS.
9. Test-drive the vehicle around a number of corners.
10. Check for DTCs with the HDS.

Is DTC 74 indicated?

YES -Go to step 11.

NO -Intermittent failure; the most probable cause is the vehicle has been driven on an extremely angled road. The system is OK at this time.

11. Turn the ignition switch to LOCK (0).
12. Substitute a known-good yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Test-drive the vehicle around a number of corners.
16. Check for DTCs with the HDS.

Is DTC 74 indicated?

YES -Check for loose terminal in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Replace the original yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

DTC 75: LATERAL/LONGITUDINAL ACCELERATION SENSOR (JOINT FAILURE); DTC 76: LATERAL/LONGITUDINAL ACCELERATION SENSOR (SOFTWARE)

NOTE: Driving on an extremely angled road can cause this DTC.

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Is DTC 97 indicated with DTC 75 or 76 at the same time?

YES -Do the DTC 97 troubleshooting (see **DTC 97: VSA SYSTEM**).

NO -Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Check that the yaw rate-lateral/longitudinal acceleration sensor is properly mounted (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

Is the yaw rate-lateral/longitudinal acceleration sensor installation OK?

YES -Go to step 5.

NO -Reinstall the yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**), and retest by test-driving.

5. Put the vehicle on a level surface.
6. Turn the ignition switch to ON (II).
7. Check the LATERAL ACCELERATION SENSOR in the VSA DATA LIST with the HDS.

Is LATERAL ACCELERATION 0 ± 1 m/s?

YES -Go to step 8.

NO -Replace the yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

8. Clear the DTC with the HDS.
9. Test-drive the vehicle around a number of corners.
10. Check for DTCs with the HDS.

Is DTC 75 or 76 indicated?

YES -Go to step 11.

NO -Intermittent failure; the most probable cause is the vehicle has been driven on an extremely angled road. The system is OK at this time.

11. Turn the ignition switch to LOCK (0).
12. Substitute a known-good yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).
13. Turn the ignition switch to ON (II).
14. Clear the DTC with the HDS.
15. Test-drive the vehicle around a number of corners.
16. Check for DTCs with the HDS.

Is DTC 75 or 76 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Replace the original yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

DTC 81: CENTRAL PROCESSING UNIT (CPU)

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 81 indicated?

YES -Replace the VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**).

NO -Intermittent failure, the system is OK at this time. Check for a loose connection at G303.

DTC 84: STEERING ANGLE SENSOR NO CENTER POINT WRITING

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

1. Turn the ignition switch to ON (II).
2. Check for DTCs with the HDS.

Are any DTCs indicated with DTC 84 at the same time?

YES -Troubleshoot any other DTCs first.

NO -Go to step 3.

3. Do the steering angle sensor center point writing with the HDS (see **STEERING ANGLE SENSOR CENTER POINT WRITING**).
4. Clear the DTC with the HDS.
5. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
6. Check for DTCs with the HDS.

Is DTC 84 indicated?

YES -Replace the steering angle sensor (see **STEERING ANGLE SENSOR REPLACEMENT**), then do the steering angle sensor center point writing (see **STEERING ANGLE SENSOR CENTER POINT WRITING**).

NO -Intermittent failure, the system is OK at this time. Check for loose terminals between the steering angle sensor 5P connector and the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

DTC 91: F-CAN COMMUNICATION

NOTE: Check the fuel and emissions systems DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**). If there are DTCs present, troubleshoot them first.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 92 indicated with DTC 91 at the same time?

YES -Do the DTC 92 troubleshooting (see **DTC 92: F-CAN SYSTEM (BUS-OFF)**).

NO -If only DTC 91 is indicated, go to step 5. If no DTCs are indicated, intermittent failure, the system is OK at this time. Check for loose terminals between the yaw rate-lateral/longitudinal acceleration sensor 4P connector, the PCM connector A (49P), and the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect the PCM connector A (49P).
8. Disconnect the VSA modulator-control unit 46P connector.
9. Check for continuity between VSA modulator-control unit 46P connector terminals No. 38, and No. 39 and PCM connector A (49P) terminals No. 49, and No. 48 individually.

Fig. 45: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminals 38, And 39

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 10.

NO -Repair open in the wire between the PCM and the VSA modulator-control unit.

10. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 4P connector.
11. Turn the ignition switch to ON (II).
12. Measure the voltage between yaw rate-lateral/ longitudinal acceleration sensor 4P connector terminal No. 1 and body ground.

**YAW RATE-LATERAL/LONGITUDINAL
ACCELERATION SENSOR 4P CONNECTOR**

Wire side of female terminals

Fig. 46: Identifying Voltage Between Yaw Rate-Lateral/ Longitudinal Acceleration Sensor 4P Connector Terminal And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 13.

NO -Repair open in the wire between the No. 29 (10 A) fuse in the under-dash fuse/relay box and the yaw rate-lateral/longitudinal acceleration sensor.

13. Turn the ignition switch to LOCK (0).
14. Check for continuity between yaw rate-lateral/ longitudinal acceleration sensor 4P connector terminal No. 4 and body ground.

**YAW RATE-LATERAL/LONGITUDINAL
ACCELERATION SENSOR 4P CONNECTOR**

Wire side of female terminals

Fig. 47: Identifying Continuity Between Yaw Rate-Lateral/ Longitudinal Acceleration Sensor 4P Connector Terminal And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair open in the wire between the yaw rate-lateral/longitudinal acceleration sensor and body

ground (G506).

15. Reconnect all connectors.
16. Test-drive the vehicle. Check the YAW RATE S in the VSA DATA LIST with the HDS while driving in corners.

Is there 0°/s indicated?

YES -Go to step 17.

NO -Check for fuel and emissions systems DTCs (see **GENERAL TROUBLESHOOTING INFORMATION**), and troubleshoot the indicated DTC.

17. Check for continuity between VSA modulator-control unit 46P connector terminals No. 38, and No. 39 and yaw rate-lateral/longitudinal acceleration sensor 4P connector terminals No. 2, and No. 3 individually.

Fig. 48: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminals No. 38, And No. 39

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Replace the yaw rate-lateral/longitudinal acceleration sensor (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT**).

NO -Repair open in the wire between the yaw rate-lateral/longitudinal acceleration sensor and the VSA modulator-control unit.

NOTE: Check the fuel and emissions systems DTCs (see GENERAL TROUBLESHOOTING INFORMATION). If there are DTCs present, troubleshoot them first.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), then turn it to ON (II) again.
4. Check for DTCs with the HDS.

Is DTC 92 indicated?

YES -Go to step 5.

NO -Intermittent failure, the system is OK at this time. Check for loose terminals between the PCM connector A (49P), and the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to INTERMITTENT FAILURES TROUBLESHOOTING .

5. Turn the ignition switch to LOCK (0).
6. Short the SCS line with the HDS.
7. Disconnect the PCM connector A (44P).
8. Disconnect the VSA modulator-control unit 46P connector.
9. Check for continuity between VSA modulator-control unit 46P connector terminals No. 38, and No. 39 and PCM connector A (49P) terminals No. 49, and No. 48 individually.

Fig. 49: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminals No. 38, And No. 39

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Repair open in the wire between the PCM and the VSA modulator-control unit.

DTC 97: VSA SYSTEM

1. Check the brake system for leaks or mechanical problems.

Is the brake system OK? (No brake fluid leakage, no air trapped in the brake system, no brake pads worn out.)

YES -Go to step 2.

NO -Repair the brake system, then recheck.

2. Turn the ignition switch to ON (II).
3. Clear the DTC with the HDS.
4. Test-drive the vehicle in a straight line. Accelerate the vehicle up to 6 mph (10 km/h), and stop, then accelerate up to 6 mph (10 km/h).
5. Check for DTCs with the HDS.

Is DTC 97 indicated?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -If any DTCs are indicated, go to the indicated **DTCS TROUBLESHOOTING**. If DTCs are not indicated, intermittent failure, the system is OK at this time. Check for loose terminals at the VSA modulator-control unit 46P connector. Check for a loose connection at G303. Refer to **INTERMITTENT FAILURES TROUBLESHOOTING** .

SYMPTOM TROUBLESHOOTING

VSA ACTIVATION INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED

1. Turn the ignition switch to ON (II), and watch the VSA activation indicator.

Does VSA activation indicator go off within 2 seconds?

YES -The system is OK at this time.

NO -Go to step 2.

2. Turn the ignition switch to LOCK (0).
3. Disconnect the VSA OFF switch 5P connector.
4. Check the VSA OFF switch (see **VSA OFF SWITCH TEST**).

Is the VSA OFF switch OK?

YES -Go to step 5.

NO -Replace the VSA OFF switch (see **VSA OFF SWITCH TEST**).

5. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
6. Disconnect gauge control module connector B (24P).
7. Check for continuity between VSA OFF switch 5P connector terminal No. 2 and body ground.

VSA OFF SWITCH 5P CONNECTOR

Wire side of female terminals

Fig. 50: Identifying Continuity Between VSA OFF Switch 5P Connector Terminal No. 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground between the gauge control module and the VSA OFF switch.

NO -Substitute a known-good gauge control module, then go to step 1 and recheck. If it is OK, replace the original gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

ABS INDICATOR, BRAKE SYSTEM INDICATOR, VSA INDICATOR, AND TRAILER STABILITY ASSIST WARNING DO NOT GO OFF AT THE SAME TIME

1. Turn the ignition switch to LOCK (0).
2. Check the No. 29 (10 A) fuse in the under-dash fuse/ relay box.

Is the fuse blown?

YES -Go to step 3.

NO -Reinstall the checked fuse, then go to step 9.

3. Disconnect the VSA modulator-control unit 46P connector.
4. Disconnect the steering angle sensor 5P connector.
5. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 4P connector.
6. Check for continuity between VSA modulator-control unit 46P connector terminal No. 40 and body ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 51: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal No. 40 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Repair short to body ground in the wire between the No. 29 (10 A) fuse in the under-dash fuse/relay box and the VSA modulator-control unit or the steering angle sensor or the yaw rate-lateral/longitudinal acceleration sensor.

NO -Go to step 7.

7. Reconnect all connectors.
8. Check the ABS indicator, brake system indicator, VSA indicator, and the trailer stability assist warning for several seconds when the ignition switch is turned to ON (II).

Do the indicators and warning come on then go off?

YES -The system is OK at this time.

NO -Go to step 14.

9. Disconnect the VSA modulator-control unit 46P connector.
10. Turn the ignition switch to ON (II).
11. Measure the voltage between VSA modulator-control unit 46P connector terminal No. 40 and body

ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 52: Identifying Voltage Between VSA Modulator-Control Unit 46P Connector Terminal No. 40 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES -Go to step 12.

NO -Repair open in the wire between the No. 29 (10 A) fuse in the under-dash fuse/relay box and the VSA modulator-control unit.

12. Turn the ignition switch to LOCK (0).
13. Check for continuity between VSA modulator-control unit 46P connector terminal No. 43 and body ground.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR

Wire side of female terminals

Fig. 53: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminal No. 43 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Go to step 15.

NO -Repair open in the wire between the VSA modulator-control unit and body ground (G303).

14. Disconnect the VSA modulator-control unit 46P connector.
15. Disconnect gauge control module connector A (12P).
16. Check for continuity between VSA modulator-control unit 46P connector terminals No. 38, and No. 39 and gauge control module connector A (12P) terminals No. 6, and No. 12 individually.

VSA MODULATOR-CONTROL UNIT 46P CONNECTOR
Wire side of female terminals

GAUGE CONTROL MODULE CONNECTOR A (12P)
Wire side of female terminals

Fig. 54: Identifying Continuity Between VSA Modulator-Control Unit 46P Connector Terminals No. 38, And No. 39

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES -Check for loose terminals in the VSA modulator-control unit 46P connector. Check for a loose connection at G303. If necessary, substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**) and retest.

NO -Repair open in the wire between the gauge control module and the VSA modulator-control unit.

STEERING ANGLE SENSOR REPLACEMENT

NOTE: Do not damage or drop the combination switch as the steering angle sensor is sensitive to shock and vibration.

1. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
2. Remove the steering column covers (see **COLUMN COVER REMOVAL/INSTALLATION**) and the cable reel (see **CABLE REEL REPLACEMENT**).
3. Remove the combination switch assembly (see step 9 on **STEERING COLUMN REMOVAL AND INSTALLATION**).
4. Remove the combination light switch (A) and the wiper/washer switch (B).

Fig. 55: Identifying Combination Light Switch, Wiper And Washer Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Replace the combination switch body assembly (C).
6. Install the combination switch in the reverse order of removal.

NOTE:

- Do not remove the steering angle sensor from the combination switch body.
- When installing the cable reel, set the turn signal canceling sleeve position (see INSTALLATION).

7. Do the steering angle sensor center point writing (see STEERING ANGLE SENSOR CENTER POINT WRITING).

STEERING ANGLE SENSOR CENTER POINT WRITING

NOTE:

Before doing the steering angle sensor center point writing, place the vehicle on a flat level surface, and turn the steering wheel to the straight ahead position while moving the vehicle.

1. With the ignition switch at LOCK (0), connect the HDS to the data link connector (DLC) (A) under the driver's side of the dashboard.

Fig. 56: Identifying HDS To Data Link Connector (DLC)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the vehicle and the VSA modulator-control unit. If it doesn't, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Do the steering angle sensor center point writing in the VSA ADJUSTMENT menu with the HDS.

NOTE: **See the HDS Help menu for specific instructions.**

5. Turn the ignition switch to LOCK (0).

YAW RATE-LATERAL/LONGITUDINAL ACCELERATION SENSOR REPLACEMENT

NOTE:

- **Do not damage or drop the sensor as it is sensitive.**
- **Do not use power tools.**

1. Turn the ignition switch to LOCK (0).
2. Remove the driver's center console trim (see step 5 on **CENTER CONSOLE REMOVAL/INSTALLATION**).
3. Disconnect the yaw rate-lateral/longitudinal acceleration sensor 4P connector (A).

Fig. 57: Identifying Yaw Rate-Lateral/Longitudinal Acceleration Sensor 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the sensor mounting bolts, then remove the yaw rate-lateral/longitudinal acceleration sensor (B).
5. Install in the reverse order of removal.
6. Do the yaw rate-lateral/longitudinal acceleration neutral position memorization (see **YAW RATE-LATERAL/LONGITUDINAL ACCELERATION NEUTRAL POSITION MEMORIZATION**).

VSA OFF SWITCH TEST

1. Turn the ignition switch to LOCK (0).
2. Remove the driver's dashboard lower cover (see **DRIVER'S DASHBOARD LOWER COVER REMOVAL/INSTALLATION**).
3. Push out the VSA OFF switch (A) from the back of the instrument panel.

Fig. 58: Identifying VSA OFF Switch And VSA OFF Switch 5P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the VSA OFF switch 5P connector (B).

5. Check for continuity between the VSA OFF switch 5P connector terminals No. 1 and No. 2. There should be continuity when the switch is pressed, and no continuity when the switch is released.

VSA OFF SWITCH 5P CONNECTOR

Terminal side of male terminals

Fig. 59: Identifying Continuity Between VSA OFF Switch 5P Connector Terminals No. 1 And No. 2
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Check for continuity between the VSA OFF switch 5P connector terminals No. 4 and No. 5. There should be continuity at all times.

VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION

NOTE:

- Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid gets on the paint, wash it off immediately with water.
- Be careful not to damage or deform the brake lines during removal and installation.
- To prevent the brake fluid from flowing, plug and cover the hose ends and joints with a shop towel or equivalent material.

REMOVAL

1. Turn the ignition switch to LOCK (0).

2. Remove the air cleaner box (see **AIR CLEANER ELEMENT INSPECTION/ REPLACEMENT**).
3. Disconnect the VSA modulator-control unit 46P connector (A) by pulling up the lock (B); the connector disconnects itself.

Fig. 61: Identifying VSA Modulator-Control Unit Components With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the six brake lines from the VSA modulator-control unit.

NOTE: Brake lines are connected to the master cylinder (C) and to the right-front (D), the left-rear (E), the right-rear (F), and the left-front (G) brake systems.

5. Remove the VSA modulator-control unit (H) with the bracket (I) from the body.
6. Remove the locknuts (J), then remove the VSA modulator-control unit from the bracket.

NOTE: During installation, install a new bushing (K) and new grommets (L). Otherwise, unwanted noise and vibration may be transmitted to the vehicle.

INSTALLATION

1. Install the new bushing and new grommets (Otherwise, unwanted noise and vibration may be transmitted to the vehicle).

2008 Acura MDX

2007-09 BRAKES VSA (Vehicle Stability Assist) System Components - MDX

2. Install the VSA modulator-control unit on the bracket, then install new locknuts.
3. Install the bracket with the VSA modulator-control unit.
4. Reconnect the six brake lines, then tighten the flare nuts with the specified torque.
5. Align the connecting surface of the VSA modulator-control unit 46P connector to the VSA modulator-control unit.
6. Lower the lock of the VSA modulator-control unit 46P connector, then confirm the connector is fully seated.
7. Reinstall the air cleaner box (see **AIR CLEANER ELEMENT INSPECTION/ REPLACEMENT**).
8. Bleed the brake system (see **BRAKE SYSTEM BLEEDING**).
9. Do the steering angle center point writing (see **STEERING ANGLE SENSOR CENTER POINT WRITING**).
10. Start the engine, and check that the ABS, the VSA indicators, and the trailer stability assist warning goes off.
11. Test-drive the vehicle, and check that the ABS, the VSA indicators, and the trailer stability assist warning do not come on.

NOTE: If the brake pedal is spongy, there may be air trapped in the modulator which could then be induced into the normal brake system during modulation. Bleed the brake system again (see **BRAKE SYSTEM BLEEDING**).

WHEEL SPEED SENSOR REPLACEMENT

FRONT

1. Turn the ignition switch to LOCK (0).
2. Remove the clip (A), then disconnect the wheel speed sensor connector (B).

Fig. 62: Identifying Wheel Speed Sensor Connector, Wheel Speed Sensor And Clip With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolts and the wheel speed sensor (C).
4. Install the wheel speed sensor in the reverse order of removal, and note these items:
 - Install the sensor carefully to avoid twisting the wires.
 - If the wheel speed sensor comes in contact with the hub bearing unit, it is faulty.
5. Start the engine, and check that the ABS, the VSA indicators, and the trailer stability assist warning goes off.
6. Test-drive the vehicle, and check that the ABS, the VSA indicators, and the trailer stability assist warning do not come on.

REAR

1. Turn the ignition switch to LOCK (0).
2. Disconnect the wheel speed sensor connector (A).

Fig. 63: Identifying Wheel Speed Sensor And Wheel Speed Sensor Connector With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the clips, the bolt, and the wheel speed sensor (B).
4. Install the wheel speed sensor in the reverse order of removal, and note these items:
 - Install the sensor carefully to avoid twisting the wires.
 - If the wheel speed sensor comes in contact with the hub bearing unit, it is faulty.
5. Start the engine, and check that the ABS, the VSA indicators, and the trailer stability assist warning goes off.
6. Test-drive the vehicle, and check that the ABS, the VSA indicators, and the trailer stability assist warning do not come on.

Security indicator does not work properly	Symptom Troubleshooting (see <u>SECURITY INDICATOR DOES NOT WORK PROPERLY</u>)	

SYSTEM DESCRIPTION

OVERVIEW

The audio unit acts as the processor for all audio functions. You can select the audio functions from the audio panel, the audio remote (on steering wheel), or by using the navigation voice control system. The audio display provides the current front and rear audio status. For vehicles with the navigation option, additional audio information is available by touching the audio button. (See the owner's manual for more details.)

Each audio component passes its audio or audio signal to the audio unit. In addition, it communicates with the audio unit via the GA-Net bus. Any open connection in this circuit will cause audio and navigation functions to appear inoperative.

The audio unit has a built-in EEPROM (electrically erasable programmable read-only memory). This memory holds the audio presets data (AM/FM radio frequency, sound settings, etc.) even when the battery is

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

disconnected.

With the ELS and the premium sound system, an audio amplifier unit powers the speakers.

The 6 DVD (6 CD) changer output can be directed to the audio unit.

The XM can be output to either the front or the RES (rear entertainment system). However, if the XM is playing in the front, the CD changer cannot be used for the RES. The RES (built into the audio unit) can be used to play a CD in the rear.

A security signal is daisy-chained between the audio, RES and navigation components for integration into the vehicle's alarm system.

SPEED-SENSITIVE VOLUME COMPENSATION (SVC)

Some audio systems are equipped with speed-sensitive volume compensation (SVC). The navigation or audio unit receives the vehicle speed pulse (VSP) from the PCM. The system processes the speed input and increases the navigation or audio system volume level as the vehicle speed increases to compensate for the various interior noise that occurs at higher speeds. When the vehicle slows down, the volume returns to its normal level. The SVC has four settings: SVC OFF, LOW, MID, and HIGH that can be adjusted using the navigation or audio unit. The SVC comes from the factory with the MID set as the default.

To change the audio unit SVC setting, press the tune folder sound knob repeatedly until the SVC is displayed, rotate the knob to adjust the SVC to the desired setting (SVC OFF, LOW, MID, or HIGH).

To change the navigation unit SVC setting, press the AUDIO button, and then select the SOUND icon on the navigation display. Press the navigation display to select the desired setting (OFF, LOW, MID, HI).

OVERVIEW

The optional navigation system provides voice control for radio, XM, CD player, and RES functions. The GA-Net (audio unit) communicates the voice control commands. When using the TALK/BACK or route guidance (RG), only the center speaker is muted and you hear the navigation instructions through the front speakers. When using HFL/AcuraLink, the center speaker, the rear speakers, and the subwoofer are muted and the front speakers give the telephone sound. When using HFL/AcuraLink and RG or TALK/BACK, the center speaker, the rear speakers, and the subwoofer are muted and you hear the telephone sound and navigation instructions through the front speakers but not the RES headphones. GA-Net bus passes the muting commands. For more information, see the **NAVIGATION SYSTEM** article. The outline of the audio interruption function is shown in the following table.

CONTENTS CHART

Contents	Audio output					
	Center CH	Left front CH	Right front CH	Right rear CH	Left rear CH	Subwoofer CH
TALK/BACK	MUTE	Navigation sound	Navigation sound	Audio	Audio	Audio

Route guidance	MUTE	Navigation sound	Navigation sound	Audio	Audio	Audio
On Star/HFL/AcuraLink	MUTE	Telephone sound	Telephone sound	MUTE	MUTE	MUTE
On Star/HFL/AcuraLink and RG or TALK/BACK	MUTE	Telephone sound and navigation sound	Telephone sound and navigation sound	MUTE	MUTE	MUTE

NOTE: All items may not apply to this vehicle. See the Owner's Manual for more information.

Audio Glossary

AUDIO GLOSSARY TERMS

Item	Definition

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

Active noise control	The active noise control system cancels some of the vehicle noise. This occurs in the 1,500-2,400 rpm range. Microphones detect the low frequency sound, and the system outputs a canceling sound from the audio speaker.
AM (Amplitude Modulation)	The type of transmission used in the standard radio broadcast band from 530 to 1705 kHz.
Amplifier	A device that increases the level of a signal by increasing the current or voltage.
Antenna	A device used to send or receive electromagnetic waves through the air.
ATA (PC Card)	A type of card that has been tested for use in playing WMA, and MP3 music files in the PC Card slot. Sizes of up to 1 GB have been tested.
Audio remote switch	The switches on the steering wheel that control the audio system.
Auxiliary Jack	Allows the client to use a portable audio device to input music recordings.
Balance	A control that changes the relative volume of the left and right channels.
Band	A range of frequencies between two definite limits. Bands are assigned by the Federal Communications Commission for specific uses.
Bass	An adjustment for the low frequency sounds of around 160 Hz and below.
Byte	A unit of storage for computer files and memory. A CD holds approximately 700 million bytes.
Cassette	Audio or video magnetic tape container having two reels. Client's can insert it for recording or play back.
Compact flash	A standard for small-size (3x4 cm), memory cards used in mobile computers, PDAs, digital cameras. Compact flash memory cards are available in size of 32 MB up to 4 GB or more and can be played in the audio PC slot. Sizes above 1 GB has not been tested.
CD (Compact Disc)	A 4.5-inch plastic disc containing digital audio recording that is played optically on a laser equipped player. Never use discs with a paper label. In a hot car, labels can curl up and jam the unit.
CD (audio disc) changer	CD player that can store and play more than one CD. Two types are available. Some units accept CDs fed into the changer one at a time, and others accept a magazine (with CD's stacked in a container).
CD player	A component designed to play compact disc CD recording using a laser optical pickup. The signal from a CD player usually requires amplification.
Distortion	Inexact reproduction of an audio signal caused by playing music at levels the audio system cannot handle.
Dolby (noise reduction)	A processing system developed by Dolby Laboratories that reduces the background noise on recording media. The result is a cleaner playback from the audio system.
DVD (Digital Versatile Disc)	A 4.5-inch CD-like format used for storing movies with digital audio and video features. The DVD-A format is a DVD format designed for DVD audio systems. Some vehicles can play DVD and DVD-A formats.
Equalizer	A device that changes the relative volume of individual frequency bands to suit personal tastes of the listener.
Fader	The control that adjusts the relative volume levels of front and rear speakers in a four-speaker system.
Format	To prepare a PC Card to receive files this function is performed on a PC. Always choose either FAT or FAT32 as the NTFS format is not accepted by the system.

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

	Pick the default sectors for the format method selected.
FM (Frequency Modulation)	The form of modulation used for radio and television sound transmission in most of the world. Less prone to interference than AM. The FM broad cast band covers roughly 87 to 108 MHz.
GA-Net	The GA-Net allows the audio unit to communicate with all the audio and navigation components in a vehicle. If there is an open in the GA-Net, components or the entire audio and navigation system may appear inoperative.
GB (Gigabyte)	A unit of memory or disk storage equal to billion bytes (1000 million bytes).
HDD	Abbreviation for hard disc drive. They are sensitive to heat and it is not recommended that they be used in the PC card slot for playing audio files.
Hertz (HZ)	The unit of frequency equal to one cycle per second (cps). One kilohertz (kHz) equals 1,000 cps; one megahertz (MHz) equals 1 million cps.
Integrated amplifier	A component that combines a pre amp and a power amp into a single unit. A receiver combines an integrated amp and a tuner into a single unit.
Jewel case	The hard plastic case that contains a compact disc or DVD. Always use a jewel case to prevent scratches on the underside of a CD or DVD.
LCD (Liquid Crystal Display)	A type of digital display that changes reflectance or transmittance when an electrical field is applied to it.
MB (Megabyte)	A unit of memory or disc storage equal to 1 million bytes.
Memory	Circuitry or devices that hold information in electrical or magnetic form, such as the AM/FM radio presets.
MB (Megabyte)	One million bytes. Written as 1 MB. Megabytes are used as a measure of digital storage space. For example, a CD can hold 650 MB.
Mic	An abbreviation for microphone. For vehicles with navigation, the microphone accepts navigation voice commands to control audio and navigation functions.
MP3 music files	MP3 is an audio coding format. MP3 is a poplar audio compression format on the Internet and computers. CDs, and PC Card with these files can be played on some vehicle's audio system.
Mute	When the navigation gives guidance, the front speakers are muted (no music). When you use the voice control system, all of the speakers are muted.
Noise	Unwanted random sounds like buzzing, hiss, pops, static, whine, etc.
PC card	The slot used for playing MP3 and WMA music files. The PC Card is usually a combination of a small flash card in a PCMCIA adaptor that slides into the slot. The ATA, SD, and compact flash types of cards have been tested up to 1 GB.
PCMCIA	A computer standard for the slot that the PC card slides into. Another term for the PC card slot.
Processor	The part of an audio device that performs task/calculations. In the audio unit the processor handles muting to allow the navi to speak voice commands, and the decoding/playback of the sound files etc.
Radio	A head unit that combines a tuner, a preamplifier, and often a power-amplifier.
SCF (Cold Start Fix) screens	These screens are displayed if the system requires a GPS initialization. The vehicle should be moved outside into an open area away from buildings/power lines.
Stereo	A recording of at least two channels where you can hear sound or music from the left or right side.

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

SD (Secure Digital) card	This compact type of memory card allows for fast data transfer and has built-in security functions. SD cards have a small write-protection switch on the side.
Shield	A metallic foil or braided wire layer surrounding conductors which are designed to prevent electrostatic or electromagnetic interference (noise) from external sources such as buzzing, or popping sounds heard on the speakers.
Speaker (Loudspeaker)	A device that converts electrical energy into acoustical energy (sound).
Speed-sensitive volume compensation (SVC)	The SVC increases the audio volume to compensate for increased interior noise when the vehicle drivers at freeway speeds.
Subwoofer	A loudspeaker made to reproduce the lowest audio frequencies, approx 25 Hz to 125 Hz.
Track	A sound recording on a CD, tape, or PC Card.
Treble	An adjustment to control the "volume" of the high frequency sounds.
Tuner	A component (or part of a component) that receives radio signals and selects one broadcast from many.
Tweeter	A speaker designed to reproduce the higher frequencies (treble) only.
Voice coil	A coil of wire wrapped around a tube and then attached to the speaker cone or diaphragm. When an audio signal is applied, the coil becomes an electromagnet and interacts with the permanent magnet causing the cone or diaphragm to vibrate. We interpret this vibrations as sound.
Volume control	Allows you to control the loudness of the music.
WMA music file	Windows Media Audio File. This is an accepted format for music files to be played on either a CD-R, a CD-RW, or a PC Card.
Woofer	A speaker that is designed to reproduce bass frequencies only.
XM radio	Satellite based radio transmission, which also uses a ground based repeater network to ensure seamless reception. The channels originate from XM's broadcast center, in Washington, DC, and up link to two satellites. These satellites transmit the signal across the entire continental United States.
XM receiver	The external component that receives and processes the XM signals from the XM satellites, and terrestrial (land) stations. The audio unit communicates to the XM receiver over the GA-Net bus.

AUDIO UNIT CONNECTOR FOR INPUTS AND OUTPUTS

When replacing an audio unit connector, match the wires to the cavities listed in the following tables.

SELF-DIAGNOSTIC FUNCTION

The audio system has a self-diagnostic function. To run the self-diagnostic function, do the following:

HOW TO CHECK FOR AUDIO SYSTEM CONDITION

1. Turn the ignition switch to ON (II).

2. Turn off the audio unit.
3. Push and hold the No. 1 and No. 6 buttons. While holding the buttons, push the VOL PUSH PWR knob to ON. Release the buttons and the self-diagnostic function begins.

Fig. 31: Identifying Audio System Buttons

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. By pressing a preset button, the input triggers the diagnostic mode that is assigned to that preset switch.

"No. 3" button

Entire LCD lighting/light-out mode: Turns on/off the entire LCD to show the presence or absence of an LCD segment failure.

"No. 4" button

Duty (for the Illumination dim) indication mode: Indicates the duty for the Illumination dim.

"No. 5" button

Vehicle speed pulse indication mode: Indicates the vehicle speed pulse.

"6 Disc" or "DVD" button (Push and hold 5 sec.)

DRAM residual quantity indication mode: Indicates the DRAM residual quantity.

"AM" or "FM" button (Push and hold 5 sec.)

Reception level check mode: Indicates the reception level. When entering the reception level check mode, the AM/FM or FM button is used to change the S-METER, OFFSET, MP and USN (A/I).

"A.SEL/ROM" button

Bus line check mode: The audio communication line is checked between the DSP, EEPROM, and TUNER.

HOW TO OBTAIN THE AUDIO UNIT SERIAL NUMBER

NOTE: **This procedure can only be done when the power has been disconnected from the audio unit, and the audio unit displays CODE.**

With the audio unit switched off, push and hold the preset buttons No. 1, No. 6 and the VOL PUSH PWR knob.

The audio unit will display the letter and the eight digits of the serial number (example 12345678). Use all eight digits as the serial number when using the iN (interactive network) to get the 5 digit anti-theft code.

SPEAKER CHECK MODE

1. Turn the ignition switch to ON (II).
2. Push and hold the No. 1 and No. 3 buttons. While holding the buttons, push the VOL PUSH PWR knob to ON. Release the buttons and the speaker check mode begins. A tone or low-frequency hum should sound from one speaker.
3. Each time you press the SEEK or CH button, the speaker outputs a beep sound in the listed order.

ERROR CODES

The audio system displays error codes when a problem is detected with the CD disc changer, the audio disc, the XM radio, or the anti-theft code.

CD Error Codes

CD ERROR CODES CHART

Error Code Displayed	Possible Cause	Solution
DISC READ	Cannot read disc.	Eject the disc and try another one, or the disc is installed up side down.
DISC ERROR	There is a problem with the disc player. A common problem is disc labels coming off the disc while in the player.	Try to eject the disc and try another one. If there is still a problem, replace the navigation unit or audio unit.
HEAT ERROR	Disc player is hot. This can happen if the vehicle is parked out in the hot sun all day.	Park the vehicle in a cooler place for a while and try the disc player again. If the error code is still present, try another disc. If the error code is still present, replace the navigation unit or audio unit.
Focus Error	Possibly DVD inserted in unit, or CD installed up side down.	Eject CD and try a known-good CD.
File Error	Audio unit cannot read the files on the CD or CD-R.	• Verify that CD/CD-R file names end in "CDA" or "WMA." • Verify that CD-R discs with compressed music formats end in "MP3" or "WMA." • Other file formats like l-tunes or "Ogg" are not recognized. • WMA files may have (DRM) copy protection and cannot be read.
Mech Error	• CD label jammed in the mechanism. • CD eject mechanism or motor is inoperative. • CD spindle motor won't spin up the CD.	Press the EJECT button and hold it for 5 seconds. If the CD does not eject, try again. If the CD still won't eject, replace the unit.

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

XM Error Codes

XM ERROR CODES CHART

Error Code Displayed	Possible Cause	Solution
LOADING	XM radio is acquiring audio or program information.	Wait until the radio receives the information.
OFF AIR	XM channel not in service.	Try another XM channel.
NO SIGNAL	Loss of signal.	Both terrestrial and satellite antennas have lost signal. Park the vehicle outside with a clear view of the southern horizon.
UPDATING	XM radio is receiving information update from the network.	This message will disappear once the update finishes.
CHECK ANTENNA	XM antenna error.	Repair open or short in the satellite antenna. Substitute the XM antenna with a known-good one, and recheck. If the error is gone, replace the original XM antenna. If the error is still present, replace the antenna lead.
ANTENNA ERROR		
--	No signal from XM.	Check a known-good vehicle with XM radio. If the known-good vehicle has the same symptoms, contact XM satellite radio at (800) 852-9696.

Audio Unit Error Codes

AUDIO UNIT ERROR CODES CHART

Error Code Displayed	Possible Cause	Solution
CODE ERROR E	Anti-theft code mismatch (1st try).	Enter the correct anti-theft code.
CODE ERROR 1	Anti-theft code mismatch (10th try).	Remove fuse No. 5 (10 A) in the under-dash fuse/ relay box, then reinsert it. You will have 10 more tries to enter the correct anti-theft code.

SYMPTOM TROUBLESHOOTING

POOR AM OR FM RADIO RECEPTION OR INTERFERENCE

NOTE:

- Check the radio reception in an open area. Poor reception/interference can be caused by any of these conditions.
- The radio station is far away.
- A tall buildings, mountains, or a high-voltage power lines are nearby.
- Check the connectors for poor connections or loose terminals.

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

- **After market window tint.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Do the seek stop test (see **SEEK STOP TEST**).and the reception level indication in the Self-diagnostic Function (See **SELF-DIAGNOSTIC FUNCTION**).

Is the test vehicle within 10 % of the known-good vehicle?

YES - Multipath interference or weak station. Operation is normal.

NO - Go to step 3.

3. Check if the radio reception/interference is the same in several locations.

Is the reception/interference the same?

YES - Go to step 4.

NO - Multipath interference or weak station. Operation is normal.

4. Check the reception/interference while the engine is running.

Is there noise (static or whine) only with the engine running?

YES - Check the antenna and radio grounds. If OK, check the charging system and the ignition system.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0).
6. Remove the tailgate spoiler trim (see **TAILGATE SPOILER TRIM REPLACEMENT**).
7. Touch one tester probe to the antenna element 1P connector No. 1 terminal, and the other tester probe at the antenna element to check for continuity.

Fig. 36: Identifying Continuity Between Antenna Element 1P Connector Terminal 1 And Antenna Element

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Replace rear spoiler trim.

8. Go into the self-diagnostic mode and use the Tuner communication check mode (see **SELF-DIAGNOSTIC FUNCTION**).

Is the tuner communication OK?

YES - Go to step 9.

NO - Audio unit is faulty, replace the audio unit.

9. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). Check that the AM/FM antenna lead and sub-lead are properly connected.

Are they connected properly?

YES - Go to step 10.

NO - Reconnect the connector, and recheck the function.

10. Disconnect the AM/FM antenna amplifier 3P connector.
11. Turn the ignition switch to ON (II).
12. Turn on the audio unit and select AM or FM.
13. Measure the voltage between AM/FM antenna amplifier 3P connector No. 3 terminal and body ground.

AM/FM ANTENNA AMPLIFIER 3P CONNECTOR

Terminal side of female terminals

Fig. 37: Identifying Voltage Between AM/FM Antenna Amplifier 3P Connector Terminal 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 20.

NO - Go to step 15.

14. Turn the ignition switch to LOCK (0).
15. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).
16. Disconnect audio unit connector H (3P).
17. Check for continuity between the audio unit connector H (3P) No. 3 terminal and AM/FM antenna amplifier 3P connector No. 3 terminal.

AUDIO UNIT CONNECTOR H (3P)
Terminal side of female terminals

AM/FM ANTENNA AMPLIFIER 3P CONNECTOR
Terminal side of female terminals

Fig. 38: Identifying Continuity Between Audio Unit H (3P) And AM/FM Antenna Amplifier 3P Connector Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair open in the wire between audio unit and the AM/FM antenna amplifier. Also check the

antenna lead/sublead connector.

18. Check for continuity between the audio unit connector H (3P) No. 3 terminal and body ground.

AUDIO UNIT CONNECTOR H (3P)

Terminal side of female terminals

Fig. 39: Identifying Continuity Between Audio Unit Connector H (3P) Terminal 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire between audio unit and the AM/FM antenna amplifier.

NO - Audio unit is faulty, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

19. Turn the ignition switch to LOCK (0).
20. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).
21. Disconnect audio unit connector H (3P).
22. Check for continuity between the audio unit connector H (3P) No. 1 terminal and AM/FM antenna amplifier 3P connector No. 1 terminal.

AUDIO UNIT CONNECTOR H (3P)
Terminal side of female terminals

AM/FM ANTENNA AMPLIFIER 3P CONNECTOR
Terminal side of female terminals

Fig. 40: Identifying Continuity Between Audio Unit H (3P) And AM/FM Antenna Amplifier 3P Connector Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 23.

NO - AM/FM antenna lead and/or sublead is faulty, replace the AM/FM antenna lead and/or sublead.

23. Check for continuity between the audio unit connector H (3P) No. 1 terminal and body ground.

AUDIO UNIT CONNECTOR H (3P)

Terminal side of female terminals

Fig. 41: Identifying Continuity Between Audio Unit Connector H (3P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - AM/FM antenna lead and/or sublead is faulty, replace the AM/FM antenna lead and/or sublead.

NO - Go to step 24.

24. Check for continuity between the audio unit connector H (3P) No. 2 terminal and AM/FM antenna amplifier 3P connector No. 2 terminal.

AUDIO UNIT CONNECTOR H (3P)

Terminal side of female terminals

AM/FM ANTENNA AMPLIFIER 3P CONNECTOR

Terminal side of female terminals

Fig. 42: Identifying Continuity Between Audio Unit H (3P) And AM/FM Antenna Amplifier 3P Connector Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 25.

NO - AM/FM antenna lead and/or sublead is faulty, replace the AM/FM antenna lead and/or sublead.

25. Check for continuity between the audio unit connector H (3P) No. 1 and No. 2 terminals.

AUDIO UNIT CONNECTOR H (3P)

Terminal side of female terminals

Fig. 43: Identifying Continuity Between Audio Unit Connector H (3P) Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the AM/FM antenna and recheck. If the reception is still poor, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO - AM/FM antenna lead and/or sublead is faulty, replace the AM/FM antenna lead and/or sublead.

POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND)

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Push the power switch ON to see if audio unit turns ON.

Does the audio unit display operate properly, and the audio unit sound normal?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Check the No. 5(10 A) fuse and No. 32 (10 A) fuse in the under-dash fuse/relay box.

Are the fuses OK?

YES - Go to step 5.

NO - Replace the fuse, and recheck.

5. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). Check that the audio unit connectors are properly connected.

Is it connected properly?

YES - Go to step 6.

NO - Repair poor connections and reconnect the connector, and recheck the function.

6. Disconnect the audio unit connector A (17P).

NOTE: Eject all the CDs before disconnecting the audio unit and CD changer to prevent damaging the CD player's load mechanism.

7. Turn the ignition switch to ON (II).
8. Measure the voltage between No. 14 and No. 17 terminals of audio unit connector A (17P) and body ground.

AUDIO UNIT CONNECTOR A (17P)

Wire side of female terminals

Fig. 44: Identifying Voltage Between Audio Unit Connector A (17P) Terminals And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair open in the wire(s) between the No. 5 (10 A) and No. 32(10 A) fuses in the under-dash fuse/relay box and the audio unit.

9. Reconnect the audio unit connector A (17P).
10. Measure the voltage between audio unit connector A (17P) No. 9 terminal and body ground.

AUDIO UNIT CONNECTOR A (17P)

Wire side of female terminals

Fig. 45: Identifying Voltage Between Audio Unit Connector A (17P) Terminal 9 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Audio unit is faulty, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO - Repair open in the wire between the audio unit connector A (17P) No. 9 terminal and body ground (G504) (see **DASHBOARD WIRE HARNESS (VIEW OF PASSENGER'S SIDE)**).

AUDIO UNIT POWER WILL NOT TURN OFF

NOTE:

- Check for aftermarket accessories plugged into the vehicle accessory power sockets.
- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. With the ignition switch ON (II), push the power switch OFF or turn the ignition switch to LOCK (0) to see if the audio unit turns OFF.

Does the audio unit turn OFF?

YES - Operation is normal.

NO - Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). Disconnect the audio unit connector A (17P).

NOTE: Eject all the CDs before disconnecting the audio unit and CD changer to prevent damaging the CD player's load mechanism.

5. Measure the voltage between the No. 14 terminal of audio unit connector A (17P) and body ground.

AUDIO UNIT CONNECTOR A (17P)

Wire side of female terminals

Fig. 46: Identifying Voltage Between Audio Unit Connector A (17P) Terminal 14 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Check for short to power on the PUR wire.

NO - Audio unit is faulty, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO SOUND IS HEARD FROM SPEAKER(S) (DISPLAY IS NORMAL) (WITH NAVIGATION)

NOTE:

- Set the fader and balance positions to the center.
- On vehicles equipped with navigation and HandsFreeLink verify the voice systems are not activated. Press each system's back button to return the audio unit to the normal operating mode.
- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and make sure the volume button is not set to the MIN level.

Is it at the MIN level?

YES - Raise the volume level, and recheck the function.

NO - Go to step 3.

3. On the steering wheel, check the navigation talk command, and/or the HandsFreeLink talk command functions.

Are the navigation talk command and/or the HFL talk command functions set?

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

YES - Cancel the navigation talk command by pressing the navigation BACK button, and for the HFL talk command, press the HFL BACK button, then recheck the function.

NO - Go to step 4.

4. Do the speaker(s) check mode with the self-diagnostic function (see **SPEAKER CHECK MODE**).

Did all speakers produce a tone?

YES - Go to step 11.

NO - Go to step 5.

5. Check the subwoofer for tone.

Did the subwoofer make a tone?

YES - Go to step 6.

NO - Go to step 29.

6. Turn the ignition switch to LOCK (0).
7. Check the faulty speaker(s) for damage.

Is there any damage?

YES - Replace the speaker and recheck.

NO - Go to step 8.

8. Remove the faulty speaker(s) that has no sound (see **SPEAKER TEST/REPLACEMENT**), and disconnect its connector.
9. Check the speaker(s) connector for a loose or poor connection.

Reconnect the speaker connector, and recheck the symptom; is the condition still present?

YES - Go to step 10.

NO - Intermittent failure. Operation is normal.

10. Test the speaker(s) (see **SPEAKER TEST/REPLACEMENT**).

Is the speaker OK?

YES - Go to step 11.

NO - Replace the speaker(s).

11. Do the audio unit self-diagnostic function DSP unit communication check (see **SELF-DIAGNOSTIC FUNCTION**).

Is the DSP communication OK?

YES - Go to step 12.

NO - Audio unit is faulty, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

12. Disconnect stereo amplifier connector B (18P).
13. Turn the ignition switch to ON (II).
14. Measure the voltage between stereo amplifier connector B (18P) No. 18 terminal and body ground.

STEREO AMPLIFIER CONNECTOR B (18P)

Wire side of female terminals

Fig. 47: Identifying Voltage Between Stereo Amplifier Connector B (18P) Terminal 18 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 15.

NO - Repair open in the wire between the No. 8 (30 A) fuse in the under-dash fuse/relay box and stereo amplifier connector B (18P) No. 18 terminal.

15. Disconnect stereo amplifier connector A (28P).
16. Measure the voltage between stereo amplifier connector A (28P) No. 3 terminal and body ground.

Fig. 48: Identifying Voltage Between Stereo Amplifier Connector A (28P) Terminal 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 17.

NO - Repair open in the wire between the stereo amplifier connector A (28P) No. 3 terminal and audio unit connector B (32P) No. 23 terminal.

17. Reconnect the stereo amplifier connector B (18P).
18. Measure the voltage between stereo amplifier connector B (18P) No. 9 terminal and body ground.

STEREO AMPLIFIER CONNECTOR B (18P)

Fig. 49: Identifying Voltage Between Stereo Amplifier Connector B (18P) Terminal 9 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Less than 0.1 V?

YES - Go to step 19.

NO - Repair open to the body ground in the wire between the stereo amplifier connector B (18P) No. 9 terminal and body ground (G504) (see **DASHBOARD WIRE HARNESS (VIEW OF PASSENGER'S SIDE)**).

19. Disconnect stereo amplifier connector B (18P) and speaker connector.

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

20. Check for continuity between body ground and stereo amplifier connector B (18P) according to the table.

CONNECTOR TERMINAL REFERENCE

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between audio unit and stereo amplifier (replace appropriate shield harness).

NO - Go to step 25.

25. Check for continuity between body ground and stereo amplifier connector A (28P) terminal No. 1, 2, and 15 individually.

Fig. 54: Identifying Continuity Between Body Ground And Stereo Amplifier Connector A (28P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between stereo amplifier and audio unit (replace the appropriate shielded harness).

NO - Go to step 26.

26. Check for continuity between audio unit connector B (32P) and stereo amplifier connector A (28P) according to the table.

CONNECTOR TERMINAL REFERENCE

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between audio unit and stereo amplifier (replace appropriate shield harness).

NO - Substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good stereo amplifier and recheck. If the symptom indicated goes away, replace the original stereo amplifier (see **STEREO AMPLIFIER REMOVAL/ INSTALLATION**).

29. Disconnect the subwoofer 8P connector.
30. Measure the voltage between subwoofer 8P connector No. 5 terminal and body ground.

SUBWOOFER 8P CONNECTOR

Wire side of female terminals

Fig. 58: Identifying Voltage Between Subwoofer 8P Connector Terminal 5 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 31.

NO - Repair open in the between the subwoofer 8P connector No. 5 terminal and No. 12 (10 A) fuse in the under-dash fuse/relay box.

31. Turn the ignition switch to ON (II).
32. Measure the voltage between subwoofer 8P connector No. 6 terminal and body ground.

SUBWOOFER 8P CONNECTOR

Wire side of female terminals

Fig. 59: Identifying Voltage Between Subwoofer 8P Connector Terminal 6 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 33.

NO - Repair open in the between the stereo amplifier connector A (28P) No. 20 terminal and subwoofer 8P connector No. 6 terminal.

33. Check for continuity between body ground and subwoofer 8P connector No. 6 terminal.

SUBWOOFER 8P CONNECTOR

Wire side of female terminals

Fig. 60: Identifying Continuity Between Body Ground And Subwoofer 8P Connector Terminal 6

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between the stereo amplifier and subwoofer.

NO - Go to step 34.

34. Turn the ignition switch to LOCK (0).

35. Check for continuity between subwoofer 8P connector No. 4 terminal and body ground.

SUBWOOFER 8P CONNECTOR

Wire side of female terminals

Fig. 61: Identifying Continuity Between Subwoofer 8P Connector Terminal 4 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 6.

NO - Repair open to the body ground in the wire between the subwoofer 8P connector No. 4 terminal and body ground (G606) (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

NO SOUND IS HEARD FROM SPEAKER(S) (DISPLAY IS NORMAL) (WITHOUT NAVIGATION)

NOTE:

- Set the fader and balance positions to the center.
- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).

2. Turn on the audio unit and make sure the volume button is not set to the MIN level.

Is it at the MIN level?

YES - Raise the volume level, and recheck the function.

NO - Go to step 3.

3. Do the speaker check mode with the self-diagnostic function (see **SPEAKER CHECK MODE**).

Did all speakers produce a tone?

YES - Go to step 9.

NO - Go to step 4.

4. Turn the ignition switch to LOCK (0).
5. Check the faulty speaker(s) for damage.

Is there any damage?

YES - Replace the speaker and recheck.

NO - Go to step 6.

6. Remove the speaker(s) that has no sound (see **SPEAKER TEST/REPLACEMENT**), and disconnect its connector.
7. Check the speaker connector for a loose or poor connection.

Reconnect the speaker connector, and recheck the symptom; is the condition still present?

YES - Go to step 8.

NO - Intermittent failure. Operation is normal.

8. Test the speaker(s) (see **SPEAKER TEST/REPLACEMENT**).

Is the speaker OK?

YES - Go to step 9.

NO - Replace the speaker(s).

9. Do the audio unit self-diagnostic function DSP unit communication check (see **SELF-DIAGNOSTIC FUNCTION**).

Is the DSP communication OK?

YES - Go to step 10.

NO - Audio unit is faulty, replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

10. Disconnect stereo amplifier connector B (18P).

NOTE: Eject all the CDs before disconnecting the audio unit and CD changer to prevent damaging the CD player's load mechanism.

11. Turn the ignition switch to ON (II).
12. Measure the voltage between stereo amplifier connector B (18P) No. 18 terminal and body ground.

Wire side of female terminals

Fig. 62: Identifying Voltage Between Stereo Amplifier Connector B (18P) Terminal 18 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Repair open in the between No. 8 (30 A) fuse in the under-dash fuse/relay box and stereo amplifier connector B (18P) No. 18 terminal.

13. Disconnect stereo amplifier connector A(20P).;
14. Measure the voltage between stereo amplifier connector A (20P) No. 1 terminal and body ground.

STEREO AMPLIFIER CONNECTOR A (20P)

Wire side of female terminals

Fig. 63: Identifying Voltage Between Stereo Amplifier Connector A (20P) Terminal 1 And Body Ground

STEREO AMPLIFIER CONNECTOR A (20P)

Wire side of female terminals

Fig. 69: Identifying Stereo Amplifier Connector A (20P) Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between audio unit and stereo amplifier (replace appropriate shield harness).

NO - Substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good stereo amplifier and recheck. If the symptom indicated goes away, replace the original stereo amplifier (see **STEREO AMPLIFIER REMOVAL/ INSTALLATION**).

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL)

NOTE:

- **Check the connectors for poor connection or loose terminals.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and check for sound in each mode (AM, FM, XM, and CD).

Is there sound from the speakers, and is the sound quality normal in each mode?

YES - Intermittent failure. The system is OK at this time. Check for loose connections at the audio unit, the amplifier, and each speaker.

NO - Speakers all work, sound quality is poor.

- If sound quality is poor only with the XM radio, or the XM radio does not function, go to **POOR OR NO SOUND WITH THE XM RADIO** .
- If the sound quality is poor only with AM or FM, go to **POOR RADIO RECEPTION OR INTERFERENCE**).
- If the sound is poor in all modes, go to **SOUND QUALITY DIAGNOSIS** .

RADIO PRESET MEMORY IS LOST

NOTE:

- **If only XM stations are lost, go to XM radio preset memory is lost (with AcuraLink) or XM radio preset memory is lost (without AcuraLink)).**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and set each of the radio station preset buttons.

Do each of the preset buttons set properly?

YES - Go to step 3.

NO - Go to step 5.

3. Turn the ignition switch to LOCK (0) for 1 minute, then turn it back to ON (II).
4. Test all the preset buttons for proper recall operation.

Do the preset buttons recall the set radio stations?

YES - System is normal at this time. Check connections at the audio unit.

NO - Go to step 5.

5. Inspect No. 5 (10 A) fuse in the under-dash fuse/ relay box.

Is it OK?

YES - Go to step 6.

NO - Replace the fuse and reset. If it fails again, repair the short to ground in the harness.

6. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).
7. Turn the ignition switch to ON (II).
8. Measure the voltage between the audio unit connector A (17P) No. 17 terminal and body ground.

AUDIO UNIT CONNECTOR A (17P)

Wire side of female terminals

Fig. 70: Identifying Voltage Between Audio Unit Connector A (17P) Terminal 17 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - An open wire between the under-dash fuse/ relay box and audio unit A17 terminal.

9. Measure the voltage between the audio unit connector A (17P) No. 9 terminal and body ground.

AUDIO UNIT CONNECTOR A (17P)

Wire side of female terminals

Fig. 71: Identifying Voltage Between Audio Unit Connector A (17P) Terminal 9 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO - An open wire between the audio unit connector A (17P) No. 9 terminal and body ground (G504).

VOLUME DOES NOT CHANGE

NOTE:

- Set the fader and balance positions to the center.
- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and check for sound in each mode (AM, FM, XM, and CD).

Is the sound normal ?

YES - Go to step 3.

NO - Go to **AUDIO SYSTEM SOUND IS WEAK OR DISTORTED** (see), or no sound is heard from speakers (see **NO SOUND IS HEARD FROM SPEAKER(S) (DISPLAY IS NORMAL) (WITH NAVIGATION)**).

3. Operate the volume knob to see if the volume changes.

Does the volume change?

YES - Operation is normal at this time.

NO - Substitute a known-good audio unit and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good audio panel and recheck. If the symptom/ indication goes away, replace the

original audio panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).

VOLUME DOES NOT INCREASE WITH SPEED

NOTE:

- **Check the connectors for poor connections or loose terminals.**
- **Check the vehicle battery condition first.**

1. Verify the (SVC) mode setting in the navigation or audio unit sound set-up.

Is the (SVC) set to off?

YES - Change the setting to Mid and reset (see **SYSTEM DESCRIPTION**).

NO - Go to step 2.

2. Do the self-diagnostic function for the vehicle speed pulse indication (see **SELF-DIAGNOSTIC FUNCTION**).

Does the self-diagnostic function indicate a VSP signal?

YES - Substitute a known-good navigation or audio unit and retest. If the symptom/indication goes away, replace the original navigation or audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO - Go to step 3.

3. Check for B-CAN codes with the HDS.

Are there any B-CAN codes?

YES - Go to the applicable B-CAN code troubleshooting.

NO - Go to step 4.

4. Inspect the VSP signal in the navigation system (see **CAR STATUS**).

Does the VSP change from 0 to 1 when the vehicle is moving?

YES - Substitute a known-good audio unit, then retest the VSP signal in the audio self-diagnostic test. If the speed is shown, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If so speed is shown, substitute a known-good navigation unit.

NO - Inspect the VSP circuit (see **NAVIGATION UNIT INPUTS AND OUTPUTS FOR CONNECTOR C (8P)**).

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

NOTE:

- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Test-drive the vehicle at highway speeds, and monitor volume level.

Is the volume level too high or too low?

YES - Go to step 2.

NO - Intermittent failure, the system is OK at this time.

2. Change the (SVC) mode setting in sound set-up to Mid (see SYSTEM DESCRIPTION).

Is the volume level still too high, or too low?

YES - Replace the audio unit (see AUDIO UNIT REMOVAL/INSTALLATION).

NO - Improper (SVC) setting for clients sound taste.

RADIO TUNER DOES NOT CHANGE STATIONS

NOTE:

- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and check the audio information on the display panel.

Does the audio information display properly?

YES - Go to step 3.

NO - Go to audio unit power switch will not turn ON (see POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND)).

3. Operate the tuning knob to see if the radio station changes.

Does the radio station change?

YES - Intermittent failure, the turning knob is OK at this time.

NO - Replace the audio unit (see AUDIO UNIT REMOVAL/INSTALLATION).

DISPLAY DOES NOT DIM OR BRIGHTEN WITH DIMMER

NOTE:

- **Check the connectors for poor connections or loose terminals.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn the headlight switch to the parking or headlight on position.
3. Check the display of the climate control unit.

Does the climate control illumination change with dimmer?

YES - Go to step 4.

NO - Go to climate control power and ground circuit troubleshooting (see **CLIMATE CONTROL UNIT TROUBLESHOOTING**).

4. Check the No. 7 (10 A) fuse and the No. 32 (10 A) fuse in the under-dash fuse/relay box.

Are the fuses OK?

YES - Go to step 5.

NO - Replace the fuse, and recheck.

5. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). Check that the audio unit and climate control unit connectors are properly connected.

Are they connected properly?

YES - Go to step 6.

NO - Repair poor connections and reconnect the connector, and recheck the function.

6. Turn the ignition switch to LOCK (0).
7. Disconnect audio unit connector C (24P) and climate control unit connector B (14P).
8. Check for continuity between the audio unit connector C (24P) No. 24 terminal and climate control unit connector B (14P) No. 8 terminal.

Fig. 72: Identifying Continuity Between Audio Unit C (24P) And Climate Control Unit Connector B (14P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair open in the wire between the audio unit connector C (24P) No. 24 terminal and climate control unit connector B (14P) No. 8 terminal.

9. Check for continuity between the body ground and audio unit connector C (24P) No. 24 terminal.

Fig. 73: Identifying Continuity Between Body Ground And Audio Unit Connector C (24P) Terminal 24

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between the audio unit and climate control unit.

NO - Go to step 10.

10. Disconnect climate control unit connector A (40P).
11. Measure the voltage between No. 1 terminal of climate control unit connector A (40P) and body ground.

Fig. 74: Identifying Voltage Between Climate Control Unit Connector A (40P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 12.

NO - Repair open in the wire(s) between No. 7 (10 A) fuse in the under-dash fuse/relay box and the climate control unit.

12. Turn the ignition switch to ON (II).
13. Measure the voltage between No. 25 terminal of climate control unit connector A (40P) and body ground.

Fig. 75: Identifying Voltage Between Climate Control Unit Connector A (40P) Terminal 25 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 14.

NO - Repair open in the wire(s) between the 32 (10 A) fuse in the under-dash fuse/relay box and the climate control unit.

14. Turn the ignition switch to LOCK (0).

15. Reconnect the audio unit connector A (17P).
16. Turn the ignition switch to ON (II).
17. Measure the voltage between climate control unit connector A (40P) No. 37 terminal and body ground.

CLIMATE CONTROL UNIT CONNECTOR A (40P)

Wire side of female terminals

Fig. 76: Identifying Voltage Between Climate Control Unit Connector A (40P) Terminal 37 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Substitute a known-good climate control unit, and recheck. If the symptom/indicated goes away, replace the original climate control unit. If the symptom is still present, substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO - Repair open in the wire between the climate control unit connector A (40P) terminal No. 37 and body ground (G506) (see **DASHBOARD WIRE HARNESS (VIEW OF PASSENGER'S SIDE)**).

AUDIO UNIT BUTTON ILLUMINATION DOES NOT WORK

NOTE:

- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn the combination lighting switch to the parking light position.
3. Check the illumination of the audio unit buttons.

Are the buttons illuminated?

YES - All buttons illuminated: Intermittent problem: the audio unit is OK at this time. Check for loose or poor connections at the audio unit connector C (24P).

Some button(s) illuminated: Audio panel is faulty, replace the audio panel.

NO - Go to step 4.

4. Check the illumination of several other buttons not related to the audio system.

Are the buttons illuminated?

YES - Go to the B-CAN line troubleshooting (see **TROUBLESHOOTING - B-CAN SYSTEM DIAGNOSIS TEST MODE A**). If the B-CAN line is OK, substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good audio panel and recheck. If the symptom/indicated goes away, replace the original audio panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).

NO - Troubleshoot the interior lights. Start by checking the No. 22 (7.5 A) fuse in the under-hood fuse/relay box. If the fuse is OK, check the interior light relay.

AUDIO DISC DOES NOT LOAD

NOTE:

- Disc labels should not be used in the audio unit. They may damage the player mechanism.
- Make sure the CD disc is compatible with the system (see the owner's manual for more information).
- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and insert known-good disc to see if the symptom can be duplicated.

Does the disc load?

YES - Operation is normal. If the disc loads normally, but will not play, go to **AUDIO DISC DOES NOT PLAY** .

NO - Go to step 3.

3. Insert another disc.

Does the disc load?

YES - The original disc is faulty.

NO - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC DOES NOT EJECT

NOTE:

- **Disc labels should not be used in the audio unit. They may damage the player mechanism.**
- **Check the connectors for poor connections or loose terminals.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit.

Does the system turn on?

YES - Go to step 3.

NO - Go to audio unit power switch will not turn ON (see **POWER SWITCH WILL NOT TURN ON (NO INFORMATION DISPLAY AND NO SOUND)**).

3. Check to see if the disc ejects correctly with no binding by pushing the EJECT button.

Does the disc eject properly?

YES - Operation is normal.

NO - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC CHANGER DOES NOT LOAD ALL SIX DISCS

NOTE:

- **Disc labels should not be used in the audio unit. They may damage the player mechanism.**
- **Check the connectors for poor connections or loose terminals.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and try loading six discs into the audio unit/CD changer.

Does the audio unit accept all six discs?

YES - Intermittent failure, the audio unit is OK at this time.

NO - Go to step 3.

3. Try loading the disc player with six known-good discs.

Does the audio unit/CD changer accept all six discs?

YES - At least one of the original discs is faulty.

NO - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO DISC CHANGER DOES NOT MOVE BETWEEN DISCS

NOTE:

- **Disc labels should not be used in the audio unit. They may damage the player mechanism.**
- **Check the connectors for poor connections or loose terminals.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and insert six discs into the audio unit/CD changer and see if the changer moves between discs.

Does the changer operate normally?

YES - Intermittent failure, the disc changer is OK at this time.

NO - Go to step 3.

3. Insert six known-good discs into the audio unit.

Does the changer operate normally?

YES - At least one of the original discs is faulty.

NO - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

Special tools required

Diagnostics CD 07AAZ-SDBA100

AUDIO DISC DOES NOT PLAY

NOTE:

- **Check the connectors for poor connections or loose terminals.**
- **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and try loading a disc.

Does the disc load?

YES - Go to step 3.

NO - Go to **DISC DOES NOT LOAD** .

3. Insert another audio disc to see if the symptom can be duplicated.

Does the disc play?

YES - Operation is normal.

NO - Go to step 4.

4. Insert audio diagnostic CD (T/N 07AAZ-SDBA100) in the audio unit.

Does the disc play?

YES - The original disc is faulty or has an unreadable format.

NO - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

Special tools required

- Diagnostics CD 07AAZ-SDBA100
- Skip test CD 07AAZ-SDBA200
- Skip test CD 07AAZ-SDBA300

AUDIO DISC SKIPS

- NOTE:**
- **Check the connectors for poor connections or loose terminals.**
 - **Check the vehicle battery condition first.**

1. Turn the ignition switch to ON (II).
2. Confirm the vehicle's tires are properly inflated.
3. Check the client's disc for scratches and fingerprints.

NOTE: **The following test should be done with the audio unit bass and treble set to the client's listening settings. When comparing to known-good vehicles, do the comparison on the same model and trim level.**

4. Test-drive the vehicle to identify when the client's disc skips. The audio diagnostic CD (T/N 07AAZ-SDBA100) can be used if the client's disc is not available; use tracks 10-12.

Does the disc skip?

YES - Go to step 5.

NO - Operation is normal.

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

5. Compare the client's skipping disc that skips to a known-good vehicle under the same conditions.

Does the disc skip in the known-good vehicle under the same conditions?

YES - The CD player operation is normal, the problem is with the client's disc.

NO - Go to step 6.

NOTE: **Do the following test with vehicle parked and the engine running.**

6. Insert the diagnostic skip test CD (T/N 07AAZ-SDBA300). Play tracks 2-11, and note on which number track(s) the disc starts skipping. Do the same test on a known-good vehicle.

Does the disc skip on same track(s) as the known-good vehicle?

YES - Operation is normal.

NO - Go to step 7.

7. Insert the diagnostic skip test CD (T/N 07AAZ-SDBA200). Play tracks 7-11 and tracks 13-15 and note on which number track(s) where the disc starts skipping. Do the same test on a known-good vehicle.

Does the disc skip on same track number(s) as the known-good vehicle?

YES - Operation is normal.

NO - Replace the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

ERROR CODE: XM NO SIGNAL OR XM ANTENNA IS DISPLAYED

NOTE:

- Check XM radio reception in an open area. Poor reception/interference can be caused by tall buildings, mountains, or high-voltage power lines.
- If you can only tune to channel 000,001,174 and 247, make sure the audio unit is set to channel mode (see), if it is set to channel mode, call XM radio customer support and check the account activation status.
- If you replace the XM receiver, the Acuralink must be reactivated by Acura Client Services.
- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Park vehicle outside with a clear view of the southern horizon.
2. Turn the ignition switch to ON (II).
3. Turn on the audio unit and select XM radio.

Does the XM radio receive a signal?

YES - Reception interference operation is normal.

NO - With AcuraLink: Go to step 5. Without AcuraLink: Go to step 12.

4. Turn the ignition switch to LOCK (0).
5. Check the XM antenna 2P connector and the XM receiver (AcuraLink control unit) connector C (2P).

Are the connectors connected?

YES - Go to step 6.

NO - Reconnect XM antenna 2P connector and XM receiver (AcuraLink control unit) connector C (2P), recheck XM radio operation. If the signal is restored, operation is normal. If signal is not restored go to step 6.

6. Disconnect XM receiver (AcuraLink) connector A (20P).
7. Measure the voltage between XM receiver (AcuraLink control unit) connector A (20P) No. 1 terminal and body ground.

**XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)**

Wire side of female terminals

Fig. 77: Identifying Voltage Between XM Receiver Connector A (20P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Repair open in the wire between No. 5 (10 A) fuse in the under-dash fuse/relay box and XM receiver (AcuraLink control unit) connector A (20P) No. 1 terminal.

8. Reconnect the XM receiver (AcuraLink control unit) connector A (20P).
9. Turn the ignition switch to ON (II).
10. Measure the voltage between XM receiver (AcuraLink control unit) connector A (20P) No. 11 terminal

and body ground.

**XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)**

Fig. 78: Identifying Voltage Between XM Receiver Connector A (20P) Terminal 11 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Go to step 11.

NO - Repair open in the wire between XM receiver (AcuraLink control unit) connector A (20P) No. 11 terminal and body ground (G606) (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

11. Substitute known-good XM antenna.

Does the XM radio receiver a signal?

YES - Replace XM antenna (see **XM ANTENNA REPLACEMENT**).

NO - Substitute a known-good XM antenna lead. If the XM receiver (AcuraLink control unit) receives a signal, replace the original XM antenna lead. If the XM receiver (AcuraLink control unit) does not receive a signal, substitute a known-good XM receiver (AcuraLink control unit).

12. Check XM antenna 2P connector and XM receiver connector B (2P).

Are the connectors connected?

YES - Go to step 13.

NO - Reconnect XM antenna 2P connector and XM receiver connector B (2P), recheck XM radio operation. If the signal restored, operation is normal. If signal not restored go to step 6.

13. Disconnect XM receiver connector A (14P).
14. Measure the voltage between XM receiver connector A (14P) No. 1 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 79: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 15.

NO - Repair open in the wire between No. 5 (10 A) fuse in the under-dash fuse/relay box and XM receiver connector A (14P) No. 1 terminal.

15. Reconnect the XM receiver connector A (14P).
16. Turn the ignition switch to ON (II).
17. Measure the voltage between XM receiver connector A (14P) No. 11 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 80: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 11 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Go to step 18.

NO - Repair open in the wire between XM receiver connector A (14P) No. 11 terminal and body ground (G606) (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

18. Substitute known-good XM antenna.

Does the XM radio receiver a signal?

YES - Replace XM antenna (see **XM ANTENNA REPLACEMENT**).

NO - Substitute a known-good XM antenna lead. If the XM receiver receives a signal, replace the original XM antenna lead. If the XM receiver does not receive a signal, substitute a known-good XM receiver unit.

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (WITH ACURALINK)

NOTE:

- Always check the connectors for poor connections or loose terminals.
- If you replace the XM receiver, the Acuralink must be reactivated by Acura Client Services.
- Check the vehicle battery condition first.

1. Disconnect the XM receiver (AcuraLink control unit) connector A (20P).
2. Measure the voltage between XM receiver (AcuraLink control unit) connector A (20P) No. 1 terminal and body ground.

**XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)**

Fig. 81: Identifying Voltage Between XM Receiver Connector A (20P) Terminal 1 And Body Ground

CONNECTOR A (20P)**

Wire side of female terminals

Fig. 85: Identifying Audio Unit D (14P) And XM Receiver (Acuralink Control Unit) Connector A (20P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire(s) between audio unit and XM receiver (AcuraLink control unit).

11. Check for continuity between body ground and XM receiver (AcuraLink control unit) connector A (20P) terminals No. 7 and 17 individually.

**XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)**

Wire side of female terminals

Fig. 86: Identifying Continuity Between Body Ground And XM Receiver (Acuralink Control Unit) Connector A (20P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between the audio unit and XM receiver (AcuraLink control unit) or between the shield wires (replace the applicable shield harness).

NO - Go to step 12.

12. Check for continuity between the terminals of XM receiver (AcuraLink control unit) connector A (20P)

according to the cable.

CONNECTOR TERMINAL REFERENCE

From terminal	To terminals
A18	A17, A7
A17	A7

XM RECEIVER (ACURALINK CONTROL UNIT) CONNECTOR A (20P)

1	2	3	4	5	6	7	8	9	10

Wire side of female terminals

Fig. 87: Identifying XM Receiver (Acuralink Control Unit) Connector A (20P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between the audio unit and XM receiver (AcuraLink control unit) (replace the appropriate shield harness).

NO - Substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit. If the symptom is still present, substitute a known-good XM receiver (AcuraLink control unit) and recheck. If the symptom indicated goes away, update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (WITHOUT ACURALINK)

NOTE:

- Check the vehicle battery condition first.
- Check the connectors for poor connections or loose terminals.

1. Turn the ignition switch to LOCK (0).
2. Disconnect XM receiver connector A (14P).
3. Measure the voltage between XM receiver connector A (14P) No. 1 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 88: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to Step 4.

NO - Repair open in the wire between No. 5 (10 A) fuse in the under-dash fuse/relay box and XM receiver connector A (14P) No. 1 terminal.

4. Turn the ignition switch to ON (II).
5. Measure the voltage between XM receiver connector A (14P) No. 11 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 89: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 11 And Body Ground

Is there less than 0.1V?

YES - Go to step 6.

NO - Repair open in the wire between XM receiver connector A (14P) No. 11 terminal and body ground (G606) (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

6. Turn the ignition switch to LOCK (0).

7. Reconnect XM receiver connector A (14P).
8. Measure the voltage between XM receiver connector A (14P) No. 2 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 90: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 10 volts or more present?

YES - Go to step 9.

NO - Substitute a known- good XM receiver and recheck. If 10 volts or more are present, replace the original XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

9. Turn the ignition switch to ON (II).
10. Measure the voltage between XM receiver connector A (14P) No. 2 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 91: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.5V?

YES - Go to step 11.

NO - Substitute a known- good audio unit and recheck. If 0.5 volts or less are present, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).

11. Turn the ignition switch to LOCK (0).
12. Disconnect audio unit connector D(14P), XM receiver connector A (14P), navigation unit connector A (20P), and navigation display unit 20P connector.
13. Check for continuity between the following terminals of the audio unit connector D (14P) and XM receiver A (14P).

CONNECTOR TERMINAL REFERENCE

Audio unit connector	XM Receiver connector	Wire color
D3	A3	BRN
D9	A9	GRN
D10	A10	RED

AUDIO UNIT CONNECTOR D (14P)

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 92: Identifying Audio Unit D (14P) And XM Receiver Connector A (14P) Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair open in the wire(s) between audio unit and XM receiver.

14. Check for continuity between body ground and XM receiver connector A (14P) terminals No. 9 and 10 individually.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 93: Identifying Continuity Between Body Ground And XM Receiver Connector A (14P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short to body ground in the wire(s) between the audio unit and XM receiver or a short between the shield wires (replace the applicable shielded harness).

NO - Go to step 15.

15. Check for continuity between the terminals of XM receiver connector A (14P) according to the cable.

CONNECTOR TERMINAL REFERENCE

A9	A10

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 94: Identifying XM Receiver Connector A (14P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between the audio unit and XM receiver (replace the appropriate shield harness).

NO - Substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good XM receiver and recheck. If the symptom/ indicated goes away, replace the original XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

XM RADIO PRESET MEMORY IS LOST (WITH ACURALINK)

NOTE:

- Check the connectors for poor connections or loose terminals.
- If you can only tune to channel 000,001,174, and 247, make sure the audio unit is set to channel mode (see owners manual), if it is set to channel mode, call XM Satellite Radio customer support and check the account activation status.
- If you replace the XM receiver, the AcuraLink must be reactivated by Acura Client Services.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and set each of the XM radio channel preset buttons.

Do each of the XM radio channel preset buttons set properly?

YES - Go to step 3.

NO - Go to step 7.

3. Turn the ignition switch to LOCK (0) for 1 minute, then turn it back to ON (II).
4. Test all of the XM radio channel preset buttons for proper recall operation.

Do the preset buttons recall the set radio stations?

YES - System is normal at this time. Check connections at the audio unit.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0).
6. Disconnect XM receiver (AcuraLink control unit) connector A (20P).
7. Measure the voltage between XM receiver (AcuraLink control unit) connector A (20P) No. 1 terminal and body ground.

XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)

Fig. 95: Identifying Voltage Between XM Receiver Connector A (20P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Repair open in the wire between the under-dash fuse/relay box and XM receiver (AcuLink control unit) connector A (20P) No. 1 terminal.

8. Turn the ignition switch to ON (II).
9. Measure the voltage between XM receiver (AcuLink control unit) connector A (20P) No. 2, and No. 12 terminals and body ground individually.

XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)

Fig. 96: Identifying Voltage Between XM Receiver Connector A (20P) Terminals And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair open in the wire between the under-dash fuse-relay box and XM receiver (AcuLink control unit) connector A (20P) No. 2 and No. 12 terminals.

10. Reconnect XM receiver (AcuLink control unit) connector A (20P).
11. Measure the voltage between XM receiver (AcuLink control unit) connector A (20P) No. 11 terminal

and body ground.

**XM RECEIVER (ACURALINK CONTROL UNIT)
CONNECTOR A (20P)**

Wire side of female terminals

Fig. 97: Identifying Voltage Between XM Receiver Connector A (20P) Terminal 11 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Update the AcuraLink control unit if it does not have the latest software, then recheck. If the software is the latest, replace the AcuraLink control unit (see **ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION**).

NO - Repair open in the wire between XM receiver (AcuraLink control unit) connector A (20P) No. 11 terminal and body ground (G606) (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

XM RADIO PRESET MEMORY IS LOST (WITHOUT ACURALINK)

NOTE:

- Check the connectors for poor connections or loose terminals.
- If you can only tune to channel 000,001,174, and 247, make sure the audio unit is set to channel mode (see owners manual), if it is set to channel mode, call XM Satellite Radio customer support and check the account activation status.
- If you replace the XM receiver, the AcuraLink must be reactivated by Acura Client Services.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and set each of the XM radio channel preset buttons.

Do each of the XM radio channel preset buttons set properly?

YES - Go to step 3.

NO - Go to step 7.

3. Turn the ignition switch to LOCK (0) for 1 minute, then turn it back to ON (II).

4. Test all of the XM radio channel preset buttons for proper recall operation.

Do the preset buttons recall the set radio stations?

YES - System is normal at this time. Check connections at the audio unit.

NO - Go to step 4.

5. Turn the ignition switch to LOCK (0).
6. Disconnect XM receiver connector A (14P).
7. Measure the voltage between XM receiver connector A (14P) No. 1 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 98: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Repair open in the wire between the under-dash fuse/relay box and XM receiver connector A (14P) No. 1 terminal.

8. Turn the ignition switch to ON (II).
9. Measure the voltage between XM receiver connector A (14P) No. 2 terminal, and body ground individually.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 99: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair open in the wire between the under-dash fuse-relay box and XM receiver connector A (14P) No. 2 terminal.

10. Reconnect XM receiver connector A (14P).

11. Measure the voltage between XM receiver connector A (14P) No. 11 terminal and body ground.

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 100: Identifying Voltage Between XM Receiver Connector A (14P) Terminal 11 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 0.1 V?

YES - Replace the XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

NO - Repair open in the wire between XM receiver connector A (14P) No. 11 terminal and body ground (G606) (see **FLOOR WIRE HARNESS (RIGHT BRANCH)**).

POOR OR NO SOUND WITH XM RADIO (AUDIO UNIT DOES DISPLAY XM CHANNELS)

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

NOTE:

- Check the XM radio reception in an open area. Poor reception/interference can be caused by nearby tall buildings, mountains, or high-voltage power lines.
- Check the connectors for poor connections or loose terminals.
- If you can only tune to channel 000, 001,174, and 247, make sure the audio unit is set to channel mode (see owners manual), if it is set to channel mode, call XM Satellite Radio customer support and check the account activation status.
- If you replace the XM receiver, the AcuraLink must be reactivated by Acura Client Services.
- Check the vehicle battery condition first.

1. Turn the ignition switch to ON (II).
2. Turn on the audio unit and select XM radio.
3. Check for an error message on the display.

Are there any messages displayed?

YES - Go to **ERROR CODE** .

NO -

- With AcuraLink: Go to step 4.
 - Without AcuraLink: Go to step 9.
4. Turn the ignition switch to LOCK (0).
 5. Disconnect audio unit connector D (14P) and the XM receiver (AcuraLink control unit) connector A (20P).
 6. Check for continuity between audio unit connector D (14P) and XM receiver (AcuraLink control unit) connector A (20P) according to the table.

CONNECTOR TERMINAL REFERENCE

XM RECEIVER CONNECTOR A (14P)

Wire side of female terminals

Fig. 106: Identifying XM Receiver Connector A (14P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity between any of the terminals?

YES - Repair short in the wire(s) between the audio unit and XM receiver.

NO - Substitute a known-good audio unit and recheck. If the symptom/indicated goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good XM receiver and recheck. If the symptom/ indication goes away, replace the original XM receiver (see **XM RECEIVER REMOVAL/INSTALLATION**).

AUDIO REMOTE SWITCH DOES NOT WORK PROPERLY

NOTE:

- Check the connectors for poor connections or loose terminals.
- Check the vehicle battery condition first.

1. Test the audio remote switch (see **AUDIO REMOTE SWITCH TEST**).

Is the audio remote switch OK?

YES - Intermittent failure, the audio remote switch and audio unit are OK at this time.

NO - Go to step 2.

2. Turn the ignition switch to ON (II).
3. Turn on the audio unit and check the audio unit operation (volume up, volume down, CH (-), CH (+), MODE).

Is the audio unit operation OK?

YES - Operation is normal.

NO - Go to step 4.

4. Turn the ignition switch to LOCK (0).

2008 Acura MDX

2007-09 ACCESSORIES AND EQUIPMENT Audio System - MDX

5. Remove the audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**).
6. Disconnect the audio unit connector B (32P).

NOTE: Eject all the CDs before disconnecting the audio unit and CD changer to prevent damaging the CD player's load mechanism.

7. Reconnect the audio remote switch. While moving the steering wheel about 3/4 turn left and right, measure the resistance between the audio unit connector B (32P) No. 3 and No. 19 terminals as specified in the table.

Fig. 107: Identifying Audio Unit Connector B (32P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

AUDIO REMOTE SWITCH TABLE

AUDIO REMOTE SWITCH CHART

Button held down	VOL DOWN	VOL UP	CH (-)	CH (+)	MODE	(NONE)
Resistance	about 100 ohms	about 357 ohms	about 775 ohms	about 1.7 kohms	about 3.7 kohms	about 10 kohms

Is the resistance OK?

YES - Go to step 8.

NO - Repair open or high resistance in the circuit between the audio unit and the audio remote switch. If the wires are OK, replace the cable reel (see **CABLE REEL REPLACEMENT**).

8. Check for continuity between body ground and the No. 3 and No. 19 terminals of audio unit connector B (32P) individually.

Fig. 108: Identifying Continuity Between Body Ground And Audio Unit Connector B (32P) Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair the short to body ground in the circuit between the audio unit and the audio remote switch. If the wires are OK, replace the cable reel (see CABLE REEL REPLACEMENT).

NO - Replace the audio unit (see AUDIO UNIT REMOVAL/INSTALLATION).

AUDIO UNIT BUTTON DOES NOT WORK

NOTE: To troubleshoot the main power switch, go to POWER SWITCH WILL NOT TURN ON (see).

1. Refer to the following switch list, and find the appropriate switch for each button. Then do the following exercise to identify the switch that does not work by operating various buttons that only belong to that switch.

Switch list Switch A: AM/FM, XM, 6DDISC, AUX, DISP, SCAN, RPT, ASEL/RDM, SEEK±, DVD, REAR PWR, FRONT SOURCE, REAR SOURCE, REAR CTRL, ELECT, ROAD, PWR, SOUND, 1-6

Switch B: INFO, MAP/GUIDE, MENU, CANCEL, SET UP, AUDIO, interface dial/ display

2. Check to see if the buttons that do not function all belong to switch A.

Are they all switch A's?

YES - Substitute a known-good audio unit and recheck. If the symptom/indication goes away, replace the original audio unit (see AUDIO UNIT REMOVAL/INSTALLATION). If the symptom is still present, substitute a known-good audio panel and recheck. If the symptom/ indication goes away, replace the original audio panel (see AUDIO UNIT REMOVAL/INSTALLATION).

NO - Go to Step 3.

3. Check to see if the buttons that do not function belong to switch B.

Are they switch B's?

YES - Faulty audio-HVAC display panel and audio unit. Replace the audio-HVAC display module.

NO - Check the connections between the interface dial and audio panel, and recheck the function. If the symptom is still present, substitute a known-good audio unit and recheck. If the symptom/ indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good audio panel and recheck. If the symptom/indication goes away, replace the original audio panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).

AUDIO UNIT DISC INDICATOR DOES NOT WORK

NOTE: **Discs with labels should not be used in the audio unit. They may damage the player mechanism.**

1. Turn on the audio system.
2. Insert a known-good disc or press the EJECT button.

Is the DISC indicator (LED) indicated?

YES - The audio unit is OK at this time. Check for loose or poor connections at audio unit and audio panel.

NO - Substitute a known-good audio unit and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good audio panel and recheck. If the symptom/ indication goes away, replace the original audio panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).

SECURITY INDICATOR DOES NOT WORK PROPERLY

NOTE:

- **The system will not operate without the 4-digit : security (anti-theft) code.**
- **Before, troubleshooting, confirm that a 4-digit security (anti-theft) code is recorded.**

1. Turn off the audio system.

Is the security indicator (LED) light on (blink)?

YES - Go to Step 2.

NO - Substitute a known-good audio unit and. recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the, symptom is still present, substitute a known-good audio panel and recheck. If the symptom/ indication goes away, replace the

original audio panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).

2. Turn on the audio system.

Is the security indicator (LED) light out?

YES - The audio unit is OK at this time. Check for loose or poor connections at audio unit and audio panel.

NO - Substitute a known-good audio unit and recheck. If the symptom/indication goes away, replace the original audio unit (see **AUDIO UNIT REMOVAL/INSTALLATION**). If the symptom is still present, substitute a known-good audio panel and recheck. If the symptom/ indication goes away, replace the original audio panel (see **AUDIO UNIT REMOVAL/INSTALLATION**).

SOUND QUALITY DIAGNOSIS

Special tools required

Diagnostics CD 07AAZ-SDBA100

Use the following tests to check sound quality.

NOTE: **Before beginning the following tests, write down the client's bass, treble, fader and balance settings, then set them to their center positions for the testing.**

LEFT/RIGHT CHANNEL ID

Do this test to confirm proper channel routing.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 1 (left, both, right channel ID) at a normal, or slightly higher than normal, volume level.
3. The voice should be audible only from the channel or channels when indicated.
 - If the channel ID is correct for each side, go to **PHASE TEST**.
 - If the channel ID is not correct, check for
 - Shorted speaker wire
 - Faulty amplifier
 - Faulty audio unit

Special tools required

Diagnostics CD 07AAZ-SDBA100

Use the following tests to check sound quality.

NOTE: Before beginning the following tests, write down the client's bass, treble, fader and balance settings, then set them to their center positions for the testing.

PHASE TEST

Do this test to confirm proper speaker phasing.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 2 (phase) at a normal, or slightly higher than normal, volume level.
3. The voice should sound centered and focused when it is in-phase.
4. The voice should sound diffused, and have "less bass" when it is out of phase.
 - If the voice changes from in-phase to out of phase as indicated by the prompt, the phasing is correct. Go to **ELECTRICAL NOISE TEST**.
 - If the voice always sounds out of phase, phasing is not correct. Check for:
 - Crossed speaker wires
 - Faulty amplifier
 - Faulty audio unit

Special tools required

Diagnostics CD 07AAZ-SDBA100

ELECTRICAL NOISE TEST

Do this test to check for electrical noise being induced into the audio system.

NOTE: Electrical noise may be caused by outside sources that cannot be handled by the audio system. Make sure you remove any cell phones and/or turn off any aftermarket devices before beginning this test.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 4 (digital zero) at a normal, or slightly higher than normal, volume level.
3. Operate any electrical device that may create electrical noise in the audio system, including starting the engine.
4. Play track No. 5 (near digital zero) at a normal, or slightly higher than normal, volume level.
5. Operate any electrical device that may create electrical noise in the audio system, including starting the engine.
6. Play track No. 6 (SNR) at a normal, or slightly higher than normal, volume level.
7. Operate any electrical device that may create electrical noise in the audio system, including starting the engine.
 - If no abnormal noise is heard, go to the **INDIVIDUAL SPEAKER TEST**.
 - If the noise is present only during the SNR track, replace the audio unit (see **AUDIO UNIT**

REMOVAL/INSTALLATION).

- If the noise is heard during the digital zero or near digital zero track, check for
 - Poor ground at the audio unit, amplifier, engine, or battery cable
 - Pinched or shorted speaker or amplifier wire
 - Faulty amplifier
 - Faulty audio unit
 - Other faulty components causing excessive electrical noise (ignition coils, alternator, door lock actuators, etc.). Disconnect any suspect components, and then replay the tracks that were originally noisy. If the noise is gone, check the component's circuit and the component.

Special tools required

Diagnostics CD 07AAZ-SDBA100

INDIVIDUAL SPEAKER TEST

Do this test to identify a faulty speaker.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 30 (steady 300 Hz tone) at a normal, or slightly higher than normal, volume level.
3. Listen to each speaker for poor sound compared to the other channels. Use the audio unit's fader and balance settings to help isolate the channel with the problem.
 - If the sound quality produced by a specific speaker is poor, substitute it with a known-good speaker. If the poor sound quality continues, go to the **SOUND BALANCE TEST** .
 - If the sound quality is OK, go to the **SOUND BALANCE TEST** .

Special tools required

Diagnostics CD 07AAZ-SDBA100

SOUND BALANCE TEST

Perform this test to identify a faulty channel or speaker.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Confirm the bass and treble are set to the center positions.
3. Play track No. 3 (pink noise) at a normal, or slightly higher than normal, volume level.
4. A "static" type sound should be heard through all speakers.
5. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit of a known-good vehicle.
6. Set the bass and treble to the center positions.
7. Play track No. 3 (pink noise) all the same level as was played in step 3.
8. Compare the sounds made by the two vehicles.

- If the sound does not have as much bass, check the subwoofer and circuit.
- If the sound does not have enough "hiss," check the tweeters and their circuits.

Special Tools Required

Diagnostics CD 07AAZ-SDBA100

FREQUENCY SWEEP

Do this test to find rattles or reverberations that may cause a perception of poor sound quality.

1. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
2. Play track No. 13 (sweep from 500 Hz to 35 Hz) at a normal, or slightly higher than normal, volume level.
3. Listen to each speaker for poor sound quality or reverberations caused by specific frequencies. Use the voice-over to estimate the frequency that causes the vibration. Use the audio unit's fader and balance settings to help isolate the channel with the problem.
 - If vibrations or poor sound quality are heard, go to step 4.
 - If no vibrations or poor sound quality are heard, go to **SOUND JUDGING** .
4. Choose the appropriate track from No. 14 to 25 (small range frequency sweep) or 26 to 53 (single frequencies) to recreate the frequency that caused the poor sound quality or vibration witnessed in step 3; this aids in diagnosis of the cause.

NOTE: **When you get to the track that recreates the problem, select the repeat function on the audio unit, this will help you isolate the cause.**

5. Replace or insulate the source of the vibration or, if the speaker is the source of the poor sound quality, replace it.

Special tools required

Diagnostics CD 07AAZ-SDBA100

SOUND JUDGING

Do this test to compare overall sound quality, imaging, and dynamics between the client's vehicle and a known-good vehicle. Only use a vehicle of the same model and trim level for this test.

1. In the client's vehicle, set the bass, treble, fader, and balance settings to the client's normal settings that were written down before beginning the test.
2. Insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
3. Play tracks No. 7 to 12 (sound quality, midland, dynamics, and imaging demonstration tracks) at a normal, or slightly higher than normal, volume level. Write down the volume setting being used.
4. Listen to areas of the track that stand out as being either very clear or poorer than other areas of the track.

5. In a known-good vehicle, insert the audio diagnostic CD (T/N 07AAZ-SDBA100) into the audio unit.
6. Play the tracks at the same volume level and the same bass, treble, balance, and fader settings as used in step 3 in the client's vehicle.
7. Listen to the same area of the track that stood out as being either very clear or poorer than other areas of the track.
8. Compare the client's vehicle's sound quality results the known-good vehicle's results.
 - If the sound quality in the client's vehicle is comparable to the sound quality in the known-good vehicle, then the client's vehicle is operating as designed.
 - If the sound quality is not comparable, check these items in order.
 - Loose or improperly installed speakers or other hardware that may create interference from the vibrations generated by the speakers
 - Poor power or ground to the stereo amplifier
 - Damaged speaker(s)
 - Faulty amplifier
 - Faulty audio unit

SEEK STOP TEST

Do this test to check the performance of the audio unit's AM and FM reception. Refer to symptom troubleshooting: audio sound weak or distorted, or no sound is heard from speakers (display is normal) (see **NO SOUND IS HEARD FROM SPEAKER(S) (DISPLAY IS NORMAL) (WITH NAVIGATION)**) before continuing with this test.

NOTE:

- **Window tint, aftermarket theft-recovery devices and other aftermarket devices may affect reception.**
- **Changes in cloud cover and other atmospheric conditions will affect the ability of the audio unit to receive radio signals.**

1. Park the client's vehicle in an open area away from buildings or other obstructions.
2. Park a known-good vehicle (same year, model, and trim level) next to the client's vehicle, facing the same direction.
3. Start the engine in the client's vehicle, and turn on the radio.
4. Set the FM receiver to 87.7 MHz.
5. Press the "Seek +" button, and record the first station that the audio unit locks onto.
6. Press the "Seek +" button repeatedly, and write down each station that the audio unit locks onto until the station recorded in step 5 is reached again.
7. Set the AM receiver to 530 kHz.
8. Press the "Seek +" button, and record the first station that the audio unit locks onto.
9. Press the "Seek +" button repeatedly, and write down each station that the audio unit locks onto until the station recorded in step 8 is reached again.
10. Turn the ignition switch to LOCK (0).

11. Start the engine in the known-good vehicle, and then perform steps 4 thru 10 on the known-good vehicle.
12. Compare the number of stations received in steps 6 and 9 in the client's vehicle with the number of stations received in the known-good vehicle.
 - If the number of stations received is the same, or within 10 %, the audio unit's tuner performance is OK. The problem may be atmospheric conditions, multi-path interference, or other obstructions to the radio signal.
 - If the client's vehicle receives fewer stations by at least 10 %, go to step 2 of poor radio reception or interference (see **POOR AM OR FM RADIO RECEPTION OR INTERFERENCE**).

AUDIO UNIT REMOVAL/INSTALLATION

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

NOTE:

- Put on gloves to protect your hands.
 - Take care not to scratch the dashboard and related parts.
 - Lay a workshop towel under the parts when working on them to protect the face panel from scratches or other damage.
 - Eject all the disc before remove the audio unit to prevent damaging the CD/DVD player's load mechanism.
 - If you are replacing the audio unit, write down the audio presets (if possible), and enter them into the new audio unit.
1. Make sure you have the anti-theft codes for the audio system and the navigation system (if equipped).
 2. Remove the driver's inner dashboard trim (see **DRIVER'S INNER DASHBOARD TRIM REMOVAL/INSTALLATION**), and front passenger's dashboard trim (see **PASSENGER'S DASHBOARD TRIM REMOVAL/INSTALLATION**).
 3. Remove the console lower trim panel (A) and the self tapping screws, then pull out the audio unit (B).

Fig. 109: Identifying Console Lower Trim Panel, Connectors And Audio Unit
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the connectors (C), then remove the audio unit.
5. Remove the climate control unit (see **DUST AND POLLEN FILTER REPLACEMENT**).
6. Remove the screws and the audio unit (A) from the audio panel (B).

Fig. 110: Identifying Audio Unit And Audio Panel
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the audio unit in the reverse order of removal, and note these items:
8. Give the new anti-theft codes to the client.
 - Make sure all the connectors and the antenna lead are secure.
 - Enter anti-theft codes for the audio system and the navigation system (if equipped).
 - Set the clock (on vehicles without navigation).
 - If necessary, enter the navigation system code.

SPEAKER TEST/REPLACEMENT

DOOR SPEAKER

1. Remove the door panel.
 - Front: (see **FRONT DOOR PANEL REMOVAL/INSTALLATION**)
 - Rear: (see **REAR DOOR PANEL REMOVAL/INSTALLATION**)
2. Remove the three mounting screws from the speaker (A).

Fig. 111: Identifying Door Speaker Mounting Screws
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 2P connector (B), and remove the speaker.
4. Measure the resistance between the No. 1 and No. 2 terminals. There should be about 2 ohms.
5. If the resistance is not as specified, replace the door speaker.

CENTER SPEAKER

NOTE:

- Put on gloves to protect your hands.
- Take care not scratch the dashboard.

1. Remove the center upper panel (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Remove the screws and the speaker (A).

Fig. 112: Identifying Center Speaker Connector Terminals

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the resistance between No. 1 and No. 2 terminals there should be about 4 ohms.
4. If the resistance is not as specified, replace the front center speaker.

TWEETER

1. Carefully pry the tweeter grille (A) out of the dashboard. Be careful not to damage the tweeter grille and the dashboard.

**Fig. 113: Identifying Tweeter Grille And Connector**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the 2P connector (B) from the tweeter.
3. Remove the tweeter speaker from the speaker grille.

**Fig. 114: Identifying Capacitor**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check the capacitor (A) condition. If any problem is found, replace the tweeter.
5. Measure the resistance between the tweeter (A) No. 2 terminal and the outside terminal of the capacitor.

There should be about 6 ohms.

Fig. 115: Identifying Resistance Between Tweeter Terminal 2 And Outside Terminal Of Capacitor
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the resistance is not as specified, replace the tweeter.

SATELLITE SPEAKER

1. Remove the quarter pillar trim (see **QUARTER PILLAR TRIM**).
2. Remove the speaker grille (A) and connector clip (B).

Fig. 116: Identifying Speaker Grille, Satellite Speaker And Connector Clip
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws and the satellite speaker (C).
4. Measure the resistance between the No. 1 and No. 2 terminals. There should be about 4 Ω.
5. If the resistance is not as specified, replace the satellite speaker.

SUBWOOFER/AMPLIFIER UNIT (WITH NAVIGATION)

1. Remove the right rear side trim panel (see **TRIM REMOVAL/INSTALLATION - REAR SIDE AREA**).
2. Disconnect the 8P connector (A), then remove the bolts, nuts and pull out the subwoofer (B).

Fig. 117: Identifying Subwoofer/Amplifier Connector Terminals - With Navigation
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

INPUT TEST

1. With the connector still disconnected, make the input tests at the connector according to the table.

TERMINAL TEST CHARTS

Terminal	Test
5	Measure the voltage to ground with all conditions: There should be battery voltage.
6	Measure the voltage to ground with audio power switch ON: There should be battery voltage.

2. Reconnect the connector to the subwoofer/ amplifier unit, and make the input test at the connector according to the table.

TERMINAL TEST CHART

Terminal	Test
4	Measure the voltage to ground with all conditions: There should be less than 0.1 V.

3. If the input test proves OK and the subwoofer has no sound, replace the faulty subwoofer/amplifier unit.

SUBWOOFER (WITHOUT NAVIGATION)

1. Remove the right rear side trim panel (see **TRIM REMOVAL/INSTALLATION - REAR SIDE AREA**).

2. Disconnect the 8P connector (A), then remove the bolts, nuts and pull out the subwoofer (B).

Fig. 118: Identifying Subwoofer Connector Terminals - Without Navigation

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the resistance between the No. 2 and No. 7 terminals and No. 3 and No. 8. There should be about 2 ohms.
4. If the resistance is not as specified, replace the subwoofer.

STEREO AMPLIFIER REMOVAL/ INSTALLATION

1. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**) and passenger's dashboard undercover (see **PASSENGER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Disconnect the connectors (A).

Fig. 119: Identifying Stereo Amplifier And Connectors

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the bolts, then pull out the stereo amplifier (B).
4. Install the stereo amplifier in the reverse order of removal.

ACURALINK CONTROL UNIT (XM RECEIVER) REMOVAL/INSTALLATION

With AcuraLink:

NOTE: The AcuraLink must be reactivated by Acura Client Services when:

- The AcuraLink control unit (XM receiver) is replaced.
- DATA RESET was selected while in the self-diagnostic function.
- Vehicle ownership changes.

1. Remove the right rear side trim panel (see TRIM REMOVAL/INSTALLATION - REAR SIDE AREA).
2. Disconnect the connectors (A), then remove the bolts and pull out the AcuraLink control unit (XM receiver) (B).

Fig. 120: Identifying Acuralink Control Unit (XM Receiver)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the AcuraLink control unit (XM receiver) in the reverse order of removal.

NOTE: If you replaced the AcuraLink control unit, make sure it has the latest

software (see UPDATING THE ACURALINK CONTROL UNIT).

XM RECEIVER REMOVAL/INSTALLATION

1. Remove the right rear side trim panel (see TRIM REMOVAL/INSTALLATION - REAR SIDE AREA).
2. Disconnect the connectors (A), then remove the bolts and pull out the XM receiver (B).

Fig. 121: Identifying XM Receiver
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the XM receiver in the reverse order of removal.

AUDIO REMOTE SWITCH TEST

1. Remove the driver's airbag assembly (see DRIVER'S AIRBAG REPLACEMENT).
2. Remove the 20P connector from the cable reel.

Fig. 122: Identifying Audio Remote Switch Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Measure the resistance between the No. 19 and No. 20 terminals in each switch position according to the table.

RESISTANCE CHART

Position	Resistance
Switch not pressed	About 10 kohms
MODE	About 3.7 kohms
CH (+)	About 1.7 kohms
CH (-)	About 775 ohms
? (VOL. UP)	About 357 ohms
? (VOL. DOWN)	About 100 ohms

- If the resistance is not as specified, replace the audio remote switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).
- Use a diode tester between the terminals in each switch position according to **Fig. 123**.

Fig. 123: Using Diode Tester Between Terminals In Each Switch Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the diode test is not as specified, replace the audio remote switch (see **STEERING WHEEL DISASSEMBLY/REASSEMBLY**).

AM/FM ANTENNA AMPLIFIER REPLACEMENT

1. Remove the headliner (see **HEADLINER REMOVAL/INSTALLATION**).
2. Disconnect the connector (A) from the AM/FM antenna amplifier (B).

Fig. 124: Identifying Connector And AM/FM Antenna Amplifier
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bolt and AM/FM antenna amplifier.
4. Install the unit in the reverse order of removal.

XM ANTENNA REPLACEMENT

1. Remove the headliner (see **HEADLINER REMOVAL/INSTALLATION**).
2. Remove the nut (A) from the XM antenna (B).

Fig. 125: Identifying XM Antenna, Nut And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the connector (C) and remove the XM antenna.
4. Install the XM antenna in the reverse order of removal.

AUXILIARY JACK ASSEMBLY REPLACEMENT

WITHOUT REAR ENTERTAINMENT

1. Open the center console.
2. Carefully pull out the auxiliary jack assembly (A), then disconnect the 5P connector (B).

Fig. 126: Identifying Auxiliary Jack Assembly And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install in the reverse order of removal.

GENERAL TROUBLESHOOTING INFORMATION

How to Check for DTCs with the Honda Diagnostic System (HDS)

When the powertrain control module (PCM) senses an abnormality in the input or output system, the D indicator (A) in the gauge assembly (B) will usually blink.

Fig. 3: Identifying D Indicator In Gauge Assembly
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) (A) (located behind the driver's dashboard lower cover), it will indicate the diagnostic trouble code (DTC) when the ignition switch is turned ON (II) and the appropriate menu is selected.

Fig. 4: Identifying Data Link Connector
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator or malfunction indicator lamp (MIL) has been reported ON, or if a driveability problem is suspected, do this procedure:

1. Connect the HDS to the DLC. (See the HDS user's service information for specific instructions.)
2. Turn the ignition switch to ON (II), select A/T system, and observe the DTC in the DTCs MENU on the HDS screen.
3. Record the freeze data and on-board snapshots for all fuel and emissions DTCs and A/T DTCs.
4. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC (except for DTC P0700, which means there is one or more A/T DTCs, and no problems were detected in the fuel and emissions circuit of the PCM).
5. Clear the DTC and data.

6. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, and then recheck for the DTC. If the A/T DTC returns, go to the **INDICATED DTCS TROUBLESHOOTING**. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

Symptom Troubleshooting Versus DTC Troubleshooting

Some symptoms will not trigger DTCs or cause the D indicator to blink. If the malfunction indicator lamp (MIL) was reported ON or the D indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause(s) for the symptom, in the sequence listed, until you find the problem.

How to Check for DTCs with the SCS Mode (retrieving the flash codes)

NOTE: The preferred method is to use the HDS to retrieve the P-code.

When the PCM senses an abnormality in the input or output system, the D indicator (A) in the gauge assembly (B) will usually blink.

Fig. 5: Identifying D Indicator In Gauge Assembly
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the D indicator has been reported ON, connect the HDS to the DLC (A) (located behind the driver's dashboard lower cover). Turn the ignition switch to ON (II), select SCS mode, then the D indicator will indicate flash the DTC.

Fig. 6: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator and the MIL come on at the same time, or if a driveability problem is suspected, do this:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II), select SCS mode, then observe the D indicator in the gauge assembly.

Codes 1 through 9 are indicated by individual short blinks. Code 10 and above are indicated by a series of long and short blinks. One long blink equals 10 short blinks. Add the long and short blinks together to determine the code.

Example: DTC 1-1

Example: DTC 15-5

Fig. 7: Identifying DTC Blinking Pattern

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Record all fuel and emissions DTCs and A/T DTCs.
4. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC (except DTC 70, which means there is one or more A/T DTCs, and no problems were detected in the fuel and emissions circuit of the PCM).
5. Clear the DTC and data.

6. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, and then recheck for DTC. If the A/T DTC returns, go to the **INDICATED DTCS TROUBLESHOOTING**. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

How to Troubleshoot Circuits at the PCM Connectors

NOTE: The PCM overwrites data and monitors the EVAP system for up to 15 minutes after the ignition switch is turned to LOCK (0). Jumping the SCS line after turning the ignition switch to LOCK (0) cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

1. Connect the HDS to the DLC (A), and jump the SCS line with the HDS.

Fig. 8: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the circuit on the PCM, according to the DTC troubleshooting, with a commercially available digital multimeter, patch cords, and pin probes at PCM harness connectors.
3. Remove the bracket (A), then free the A/C discharge line from the clip (B). Remove the A/C suction line mounting bracket bolt (C), then remove the PCM cover (D) and disconnect PCM connectors (E).

NOTE: PCM connectors A, B, and C have symbols (A= $\square$, B= Δ , C=o) embossed on them for identification.

Fig. 9: Identifying PCM Connectors

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Check the connector inspection port (A) size, and select a suitable pin probe.

Fig. 10: Identifying Connector Inspection Port

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect one end of the patch cords (A) to a digital multimeter (B), and connect the other patch cord terminal to a commercially available jack (Pomona Electronics Tool No. 3563 or equivalent) (C).

Fig. 11: Identifying Patch Cords To Digital Multimeter

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Gently slide the pin probe into the inspection port at the connector terminal side. Always use the inspection port. Do not slide the probe into the connector terminals.

NOTE:

- For accurate results, always use the pin probe (male).
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.

Clear A/T DTCs Procedures

1. Connect the HDS to the DLC (A).

Fig. 12: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II).
3. Make sure the HDS communications with the PCM. IF it does not, go to the DLC circuit troubleshooting (see **DTC TROUBLESHOOTING**)
4. Clear the DTC(s) on the HDS screen.

OBD Status

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if the technician's repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: On board diagnosis has successfully completed.
- FAILED: On board diagnosis has completed but failed.

- **NOT COMPLETED:** The on board diagnosis was running but is out of the enable conditions of the DTC.

How to End a Troubleshooting Session (required after any troubleshooting)

NOTE: **Reset the PCM with the HDS while the engine is stopped.**

1. Turn the ignition switch to LOCK (0).
2. Turn the ignition switch to ON (II), and wait for 30 seconds.
3. Turn the ignition switch to LOCK (0), and disconnect the HDS from the DLC.
4. Do the PCM idle learn procedure (see **PCM IDLE LEARN PROCEDURE**).
5. Start the engine in P or N, and warm it up to normal operating temperature (the radiator fan comes on).
6. To check that the problem is repaired, test-drive the vehicle for several minutes at speeds over 30 mph (48 km/h) or under the same conditions as those indicated by the freeze data.

Substitute the PCM**Special Tools Required**

- Honda diagnostic system (HDS) tablet tester
- Honda interface module (HIM) and an IN workstation with HDS and CM update software
- HDS pocket tester
- GNA600 and an IN workstation with HDS and CM update software

Use any one of these update tools.

NOTE: **Use this procedure when you have to substitute a known-good PCM during a troubleshooting procedure**

1. Connect the HDS to the DLC (A) located behind the driver's side of the dashboard.

Fig. 13: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the PCM. If it doesn't, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**). If you are returning from the DLC circuit troubleshooting, skip steps 5 to 6, and clean the throttle body after substituting the PCM (see **THROTTLE BODY CLEANING**).
4. Select the INSPECTION MENU with the HDS.
5. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the HDS screen prompts.

NOTE: If the TP POSITION CHECK indicates FAILED, continue this procedure.

6. Turn the ignition switch to LOCK (0).
7. Do the battery removal procedure (see **REMOVAL**).
8. Remove the bracket (D), then free the A/C discharge line from the clip (E). Remove the A/C suction line mounting bracket bolt (F).

Fig. 14: Identifying PCM Connectors With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the PCM cover (G), disconnect PCM connectors A, B, and C, and remove the mounting bolts, then remove the PCM.
10. Install the PCM and battery cables in the reverse order of removal.
11. Do the battery installation procedure (see **INSTALLATION**).
12. Turn the ignition switch to ON (II).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NOTE: If DTC P0630 "VIN not Programmed or Mismatch" will be stored because the VIN has not been programmed into the PCM; ignore it, and continue this procedure.

13. Manually input the VIN to the PCM with the HDS.
14. Update the PCM if it does not have the latest software.
15. Select the IMMOBI SYSTEM with the HDS.
16. Enter the immobilizer code using the PCM replacement procedure in the HDS; this allows you to start the engine.
17. Reset the PCM with the HDS.
18. Select the ETCS TEST, then select the TP POSITION CHECK, and follow the HDS screen prompts. If the TP POSITION CHECK failed, clean the throttle body (see **THROTTLE BODY CLEANING**).
19. Do the PCM idle learn procedure (see **PCM IDLE LEARN PROCEDURE**).
20. Do the CKP learn procedure (see **CRANK (CKP) PATTERN CLEAR/CRANK (CKP) PATTERN LEARN**).

DTC TROUBLESHOOTING INDEX

NOTE: Before you troubleshoot, record all freeze data and review the General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

DTC TROUBLESHOOTING INDEX

DTC ⁽¹⁾	D Indicator	MIL	Detection Item
<u>P0107</u> (12-7)	Blinks	OFF or ON ⁽³⁾	Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage Input
<u>P0108</u> (12-8)	Blinks	OFF or ON ⁽³⁾	Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage Input
<u>P0335</u> (88-2)	Blinks	OFF or ON ⁽³⁾	Crankshaft Position (CKP) Sensor A No Signal
<u>P0339</u> (88-6)	Blinks	OFF or ON ⁽³⁾	Crankshaft Position (CKP) Sensor A Intermittent Interruption
<u>P0340</u> (126-2)	Blinks	OFF or ON ⁽³⁾	Camshaft Position (CMP) Sensor No Signal

P0723 (9-6) ⁽²⁾	Blinks	ON	Output Shaft (Countershaft) Speed Sensor Intermittent

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Failure

- (1) The DTC in parentheses is the Honda code that you will see when you use the SCS mode. The first number(s) before the - (hyphen) is the flash code the D indicator indicates when the data link connector (DLC) is connected to the HDS, and in the SCS mode.
- (2) This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.
- (3) The MIL comes on when the PGM-FI control system detects a failure simultaneous with the A/T DTC.

NOTE: Before you troubleshoot, record all freeze data and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

DTC TROUBLESHOOTING INDEX (CONT.)

DTC ⁽¹⁾	D Indicator	MIL	Detection Item
P0731 (64-1)	Blinks	OFF	Problem in 1st Clutch and 1st Clutch Hydraulic Circuit
P0732 (64-2)	Blinks	OFF	Problem in 2nd Clutch and 2nd Clutch Hydraulic Circuit
P0733 (64-3)	Blinks	OFF	Problem in 3rd Clutch and 3rd Clutch Hydraulic Circuit
P0734 (64-4)	Blinks	OFF	Problem in 4th Clutch and 4th Clutch Hydraulic Circuit
P0735 (64-5)	Blinks	OFF	Problem in 5th Clutch and 5th Clutch Hydraulic Circuit

(3) The MIL comes on when the PGM-FI control system detects a failure simultaneous with the A/T DTC.			

SYMPTOM TROUBLESHOOTING INDEX

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Probable cause(s)	Notes
When you turn the ignition switch to ON (II), the D indicator comes on and stays on in all shift lever positions, or it never comes on at all	- F-CAN communication line error - Gauge control module defective - PCM defective	- Check the F-CAN communication line for a DTC (see <u>DTC B1168</u>). - Check the F-CAN communication line by using the gauge control module self-diagnostic function (see <u>THE COMMUNICATION LINE CHECK</u>). - Check the indicator drive circuit in the gauge control module by using gauge control module self-diagnostic function (see <u>SELF-DIAGNOSTIC FUNCTION</u>).
A/T gear position indicator does not come on while the shift lever is in that position	- F-CAN communication line error - Gauge control module defective - PCM defective - Transmission range switch defective	- Check the F-CAN communication line for a DTC (see <u>DTC B1168</u>). - Check the F-CAN communication line by using the gauge control module self-diagnostic function (see <u>THE COMMUNICATION LINE CHECK</u>). - Check the indicator drive circuit in the gauge control module by using gauge control module self-diagnostic function (see <u>SELF-DIAGNOSTIC FUNCTION</u>). - Inspect the transmission range switch (see <u>TRANSMISSION RANGE SWITCH TEST</u>).
M indicator does not come on in M position	- F-CAN communication line error - Gauge control module defective	- Check the F-CAN communication line for a DTC (see <u>DTC B1168</u>). - Check the F-CAN communication line by using the gauge control module self-diagnostic function (see <u>THE COMMUNICATION LINE CHECK</u>). - Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see <u>SELF-DIAGNOSTIC</u>).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

	• PCM defective	<u>FUNCTION</u>). • Inspect the transmission gear selection switch (see <u>TRANSMISSION GEAR SELECTION SWITCH TEST</u>).
Shift indicator does not work in sequential sportshift mode	• F-CAN communication line error • Gauge control module defective • PCM defective	• Check the F-CAN communication line for a DTC (see <u>DTC B1168</u>). • Check the F-CAN communication line by using the gauge control module self-diagnostic function (see <u>THE COMMUNICATION LINE CHECK</u>). • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see <u>SELF-DIAGNOSTIC FUNCTION</u>). • Inspect the transmission gear selection switch (see <u>TRANSMISSION GEAR SELECTION SWITCH TEST</u>).
Shift lever cannot be moved from P while you are pressing on the brake pedal	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor defective • Brake pedal position switch circuit • Brake pedal position switch defective • Shift lock solenoid defective • Shift lock solenoid control circuit • Shift lock solenoid mechanism • Throttle body defective • Transmission range switch ATP P switch stuck OFF • Transmission range switch ATP P switch line	• Troubleshoot the shift lock system circuit (see <u>SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING</u>). • Test the shift lock solenoid (see <u>SHIFT LOCK SOLENOID TEST</u>). • Inspect the transmission range switch (see <u>TRANSMISSION RANGE SWITCH TEST</u>).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

	opened	
Ignition switch cannot be moved from ACCESSORY (1) to LOCK (0) (key is pushed in, the shift lever in P)	• Interlock control system circuit • Key interlock solenoid stuck ON • Park pin switch stuck ON • Transmission range switch ATP P line opened	• Troubleshoot the key interlock system circuit (see <u>KEY INTERLOCK SYSTEM CIRCUIT TROUBLESHOOTING</u>). • Inspect the transmission range switch (see <u>TRANSMISSION RANGE SWITCH TEST</u>).
HDS does not communicate with the PCM or the vehicle	DLC circuit	Troubleshoot the DLC circuit (see <u>DLC CIRCUIT TROUBLESHOOTING</u>).
Engine runs, but vehicle does not move in any gear	1. Low ATF level 2. Shift cable broken or out of adjustment 3. Connection between shift cable and transmission or body is worn 4. ATF pump worn or binding 5. Regulator valve stuck or spring worn 6. ATF strainer clogged 7. Foreign material in separator plate orifice 8. Mainshaft worn or damaged 9. Countershaft worn or damaged 10. Final gears worn or damaged 11. Park mechanism defective 12. Drive plate worn or damaged	• Check the ATF level and check the ATF cooler lines for leakage and loose connections. If necessary, clean the ATF cooler lines. • Check for a loose shift cable at the shift lever and the transmission control lever. • Improper alignment of ATF pump and torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Check the line pressure. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, and thoroughly clean the transmission, and clean the cooler and lines. Replace the torque converter. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will result in ATF pump seizure if not detected. Use the proper tools. • Install the main seal flush with the torque converter housing. If you push it into the torque converter

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

	13. Torque converter worn or damaged 14. Transmission-to-engine assembly error 15. Axle disengaged	housing until it bottoms out, it will block the fluid return passage and result in damage.
Vehicle moves in R, but not in D, D3, or 1st in M	1. 1st accumulator defective 2. Idler gears worn or damaged 3. 1st clutch defective 4. 5th clutch defective	• Check the 1st and 5th clutch pressures. • Inspect the secondary shaft and 1st/1st-hold clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Vehicle moves in M and R, but not in D or D3	• 1st gear one-way clutch defective • 1st gears worn or damaged • 1st clutch defective	• Check the 1st clutch pressure. • Inspect the 1st gears and one-way clutch for wear and damage. • Inspect the 1st clutch for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Vehicle moves in D, D3, 2nd in M, and R, but not in 1st in M	1st-hold clutch defective	• Check the 1st-hold clutch pressure. • Inspect the secondary shaft and 1st/1st-hold clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

		wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Vehicle moves in D, D3, 1st in M, and R, but not in 2nd in M	1. 2nd accumulator defective 2. 2nd clutch defective	• Check the 2nd clutch pressure. • Inspect the secondary shaft and 2nd clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Vehicle moves in D, D3, and M, but not in R	1. Shift fork shaft stuck 2. 5th accumulator defective 3. 5th clutch defective 4. Reverse gears worn or damaged 5. Reverse idler gear shaft/holder worn or damaged	• Check the 5th clutch pressure. • Check for a missing shift fork bolt on the shift fork shaft. • Inspect the reverse selector gear teeth chamfers, and inspect the engagement teeth chamfers of the countershaft 5th gear and reverse gear. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes clicking, grinding, or whirring noises, also replace the mainshaft 5th gear, reverse idler gear, and countershaft 5th gear. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
	1. Low ATF level 2. Shift cable broken	• Check the ATF level and check the ATF cooler

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Poor acceleration; flares when starting off in D, D3, and Ft	or out of adjustment - Torque converter one-way clutch defective - Stator shaft defective - ATF pump worn or binding - Regulator valve stuck or spring worn - ATF strainer clogged - Torque converter check valve defective - Shift valve E defective	lines for leakage and loose connections. If necessary, clean the ATF cooler lines. - Check for a loose shift cable at the shift lever and the transmission control lever. - Check the line pressure. - Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. - Improper alignment of ATF pump and torque converter housing may cause ATF pump seizure. The symptom is mostly an rpm-related ticking noise or a high pitched squeak. - Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will result in ATF pump seizure if not detected. Use the proper tools.
Poor acceleration; flares when starting off in D, D3, and R; stall speed high in D and D3	1st accumulator defective 1st clutch defective	- Check the 1st clutch pressure. - Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Poor acceleration; flares when starting off in D, D3, and R; stall speed high in 1st in M	1st-hold clutch defective	- Check the 1st-hold clutch pressure. - Inspect the secondary shaft and 1st/1st-hold clutch assembly for wear and damage. - Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

		the clearance with the clutch end-plate.
Poor acceleration; flares when starting off in D, D3, and R; stall speed high in 2nd in M	• 2nd accumulator defective • 2nd clutch defective	• Check the 2nd clutch pressure. • Inspect the secondary shaft and 2nd clutch assembly for wear and damage. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Poor acceleration; flares when starting off in D, D3, and R; stall speed high in R	1. Shift cable broken or out of adjustment 2. 5th accumulator defective 3. 5th clutch defective	• Check for a loose shift cable at the shift lever and the transmission control lever. • Check the 5th clutch pressure. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
Poor acceleration; flares when starting off in D, D3, and R; stall speed low	1. Engine output low 2. Torque converter clutch piston defective	Replace the torque converter.
Engine idle vibration	1. Low ATF level 2. Engine output low 3. Torque converter clutch piston defective	• Adjust the engine and transmission mounts. • Check the ATF level and check the ATF cooler lines for leakage and loose connections. If necessary, clean the ATF cooler lines. • Replace the torque converter.
	1. Excessive ATF 2. ATF temperature sensor defective 3. Foreign material in separator plate	

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Vehicle moves in N	orifice 4. Relief valve defective 5. Lubrication control valve defective 6. 1st-hold clutch defective 7. 1st clutch defective 8. 2nd clutch defective 9. 3rd clutch defective 10. 4th clutch defective 11. 5th clutch defective 12. Clearance between the top end-plate and top disc incorrect 13. Needle bearing seized up, worn, or damaged	• Check the ATF level, and drain the ATF if necessary. • Check all clutch pressures. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end-plate.
	1. Shift solenoid valve A defective 2. Shift solenoid valve B defective 3. Shift solenoid valve C defective 4. A/T clutch pressure control solenoid valve C defective 5. Shift cable broken or out of adjustment 6. Connection between shift cable and transmission or body is worn	• Check for a stored DTC, and check for loose connectors. • Inspect the O-ring, and check the shift solenoid valve for seizure. • Inspect the A/T clutch pressure control solenoid valve body gasket and ATF feed pipes for wear and damage. If the A/T clutch pressure control solenoid valve is stuck, inspect the CPC valves.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Late shift after shifting from N to D or D3, or excessive shock when shifting	7. ATF temperature sensor defective 8. CPC valve C defective 9. Foreign material in separator plate orifice 10. Shift valve A defective 11. Shift valve D defective 12. Shift valve E defective 13. ATF strainer clogged 14. 1st accumulator defective 15. 2nd accumulator defective 16. 1st check ball stuck 17. 1st clutch defective 18. Clutch end plate clearance incorrect	• Check for a loose shift cable at the shift lever and the transmission control lever. • Check the 1st clutch pressure. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end plate.
Late shift after shifting from N to R, or excessive shock when shifting	1. A/T clutch pressure control solenoid valve C defective 2. Shift cable broken or out of adjustment 3. Connection between shift cable and transmission or body is worn 4. ATF temperature sensor defective 5. Reverse CPC valve defective 6. Foreign material in separator plate	• Check for a stored DTC, and check for loose connectors. • Inspect the O-ring, and check the shift solenoid valve for seizure. • Inspect the A/T clutch pressure control solenoid valve body gasket and ATF feed pipes for wear and damage. If the A/T clutch pressure control solenoid valve is stuck, inspect the CPC valves. • Check for a loose shift cable at the shift lever and the transmission control lever. • Check the 5th clutch pressure. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

	orifice 7. ATF strainer clogged 8. 5th clutch defective 9. Clutch end plate clearance incorrect	end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end plate.
Transmission does not shift	1. Input shaft (mainshaft) speed sensor defective 2. Output shaft (countershaft) speed sensor defective	Check for a stored DTC, and check for loose connectors.
Excessive shock or flares on all upshifts and downshifts	1. Input shaft (mainshaft) speed sensor defective 2. Output shaft (countershaft) speed sensor defective 3. ATF temperature sensor defective 4. Foreign material in separator plate orifice	Check for a stored DTC, and check for loose connectors.
	1. Shift solenoid valve A defective 2. Shift solenoid valve B defective 3. Shift solenoid valve C defective 4. A/T clutch pressure control solenoid valve A defective 5. A/T clutch pressure control solenoid valve B defective 6. A/T clutch pressure control	• Check for a stored DTC, and check for loose connectors. • Inspect the A/T clutch pressure control solenoid valve body gasket and ATF feed pipes for wear and damage. If the A/T clutch pressure control solenoid valve is stuck, inspect the CPC valves.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Excessive shock or flares on 1-2 upshift or 2-1 downshift	solenoid valve C defective 7. 2nd clutch transmission fluid pressure switch defective 8. CPC valve A defective 9. CPC valve B defective 10. CPC valve C defective 11. Shift valve C defective 12. Shift valve D defective 13. Foreign material in separator plate orifice 14. 2nd accumulator defective 15. 2nd clutch defective 16. Clutch end plate clearance incorrect	• Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector. • Check the 1st and 2nd clutch pressures. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end plate.
	1. Shift solenoid valve D defective 2. A/T clutch pressure control solenoid valve A defective 3. A/T clutch pressure control solenoid valve B defective 4. A/T clutch pressure control solenoid valve C defective 5. 3rd clutch transmission fluid pressure switch defective	• Check for a stored DTC, and check for loose connectors. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Inspect the A/T clutch pressure control solenoid valve body gasket and ATF feed pipes for wear and damage. If the A/T clutch pressure control solenoid

Excessive shock or flares on 2-3 upshift or 3-2 downshift	6. Shift fork shaft stuck 7. CPC valve A defective 8. CPC valve B defective 9. Foreign material in separator plate orifice 10. Servo control valve defective 11. Lock-upshift valve defective 12. 2nd accumulator defective 13. 3rd accumulator defective 14. 2nd check ball stuck 15. 2nd clutch defective 16. 3rd clutch defective 17. Clutch end plate clearance incorrect	valve is stuck, inspect the CPC valves. • Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector. • Check the 2nd and 3rd clutch pressures. • Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end plate.
Excessive shock or flares on 3-4 upshift	1. A/T clutch pressure control solenoid valve A defective 2. A/T clutch pressure control solenoid valve B defective 3. A/T clutch pressure control solenoid valve C defective 4. 4th clutch transmission fluid pressure switch defective 5. Shift fork shaft	• Check for a stored DTC, and check for loose connectors. • Inspect the O-rings, and check the shift solenoid valve for seizure. • Inspect the A/T clutch pressure control solenoid valve body gasket and ATF feed pipes for wear and damage. If the A/T clutch pressure control solenoid valve is stuck, inspect the CPC valves. • Check for clogged orifice in the transmission fluid pressure switch connector. If the orifice is clogged, remove it and clean the connector. • Check the 3rd and 4th clutch pressures.

or 4-3 downshift	stuck - Foreign material in separator plate orifice - Servo control valve defective 3rd accumulator defective 4th accumulator defective 3rd clutch defective 4th clutch defective - Clutch end plate clearance incorrect	Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end plate.
Excessive shock or flares on 4-5 upshift or 5-4 downshift	- A/T clutch pressure control solenoid valve A defective - A/T clutch pressure control solenoid valve B defective - A/T clutch pressure control solenoid valve C defective - Foreign material in separator plate orifice 4th accumulator defective 5th accumulator defective 4th clutch defective 5th clutch defective - Clutch end plate clearance incorrect	- Check for a stored DTC, and check for loose connectors. - Inspect the O-rings, and check the shift solenoid valve for seizure. - Inspect the A/T clutch pressure control solenoid valve body gasket and ATF feed pipes for wear and damage. If the A/T clutch pressure control solenoid valve is stuck, inspect the CPC valves. - Check the 4th and 5th clutch pressures. - Inspect the clutch piston, clutch piston check valve, and O-rings. Check the spring retainer for wear and damage. Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, inspect the clutch discs and plates for wear and damage, and also inspect the clutch wave-plate height. If the discs and plates are worn or damaged, replace the discs and plates as a set. If the wave-plate height is out of tolerance, replace the wave-plate. If the discs and plates are OK, adjust the clearance with the clutch end plate.
	ATF pump worn	

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Noise from transmission in all shift lever positions	- or binding 2. ATF strainer clogged 3. Idler gears worn or damaged 4. Bearings on mainshaft, countershaft, secondary shaft, and intermediary shaft worn or damaged 5. Thrust washer seized up, worn, or damaged	• Improper alignment of ATF pump and torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will result in ATF pump seizure if not detected. Use the proper tools.
Vehicle does not accelerate above 31 mph (50 km/h)	Torque converter one-way clutch defective	Replace the torque converter.
Vibration in all shift lever positions	1. ATF pump worn or binding 2. Torque converter worn or damaged 3. Drive plate defective or transmission misassembled	• Adjust the engine and transmission mounts. • Check the stall speed. • Check the ATF strainer for debris. If the ATF strainer is clogged with particles of steel or aluminum, inspect the ATF pump. If the ATF pump is OK, find the damaged components that caused the debris. If no cause for the contamination is found, replace the torque converter.
Shift lever does not operate smoothly	1. Transmission range switch defective or out of adjustment 2. Shift cable broken or out of adjustment 3. Connection between shift cable and transmission or body is worn 4. Manual valve defective 5. Selector control shaft worn or damaged	• Check for a stored DTC, and check for loose connectors. • Inspect the transmission range switch. If the transmission range switch is faulty, replace it. If the transmission range switch is out of adjustment, adjust it and the shift cable. • Check for a loose shift cable at the shift lever and the transmission control lever.
	1. Shift cable broken

SYSTEM DESCRIPTION

General Operation

The automatic transmission is a combination of a three-element torque converter and a four-shaft electronically controlled unit which provides five speeds and one in reverse. The entire unit is positioned in line with the engine.

Torque Converter, Shafts, Gears, and Clutches

The torque converter consists of a pump, turbine, and stator assembly in a single unit. The converter housing (pump) is connected to the engine crankshaft and turns as the engine turns. Around the outside of the torque converter is a ring gear which meshes with the drive gear when the engine is being started. The entire torque converter assembly serves as a flywheel, transmitting power to the transmission mainshaft. The transmission has four parallel shafts: the mainshaft, the countershaft, the secondary shaft, and the intermediary shaft. The mainshaft is in line with the engine crankshaft. The mainshaft includes the 4th and 5th clutches, and gears for 3rd, 4th, 5th, and reverse (reverse gear is integral with 5th gear). The countershaft includes gears for the final drive, 2nd, idler, 1st, 4th, 5th, and reverse (the final drive gear is integral with the countershaft). The secondary shaft includes the 1st, 1st-hold, and 2nd clutches, and gears for park, 2nd, idler, and 1st. The intermediary shaft includes the 3rd clutch, and gears for 3rd and 4th. The countershaft 5th gear and the countershaft reverse gear can be locked to the countershaft at its left end, providing 5th gear or reverse, depending with which way the selector is moved. The gears on the mainshaft, secondary shaft, and intermediary shaft are in constant mesh with those on the countershaft. When certain conditions of gears in the transmission are engaged by the clutches, power is transmitted through the mainshaft, and/or to the secondary shaft, intermediary shaft, then to the countershaft to provide drive.

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, and seven solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions. The PCM is located in the engine compartment.

Hydraulic Control

The valve bodies include the main valve body, the regulator valve body, the secondary valve body, and the accumulator body. They are bolted to the torque converter housing. The main valve body contains the manual valve, the modulator valve, the torque converter check valve, shift valves A, B, E, CPC valve A, the relief valve, the servo control valve, the lock-up shift valve, the lock-up timing valve, the lubrication control valve, the lubrication check valve, and the ATF pump gears. The secondary valve body contains shift valves C, D, CPC valves B and C, the reverse CPC valve, and the reverse control valve. The regulator valve body contains the regulator valve, the cooler check valve, the lock-up control valve, and the 3rd accumulator. The accumulator body contains the 1st, 1st-hold, 2nd, 4th, and 5th accumulators, shift solenoid valves A, B, C, and D. Fluid from the regulator valve passes through the manual valve to the various control valves. All the clutch receive fluid from the internal hydraulic circuit.

Shift Control Mechanism

To shift gears, the PCM controls shift solenoid valves A, B, C, and D, and automatic transmission (A/T) clutch pressure control solenoid valves A, B, and C, while receiving input signals from various sensors and switches located throughout the vehicle. The shift solenoid valves shift the positions of the shift valves to switch the port to send hydraulic pressure to the clutches. A/T clutch pressure control solenoid valves A, B, and C control the CPC valves A and B, and reverse CPC valve to shift smoothly between lower and higher gear. This pressurizes a line to one of the clutches, engaging the clutch and its corresponding gear.

Lock-up Mechanism

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

The lock-up mechanism operates in 2nd, 3rd, 4th, and 5th gears in D, and in 2nd and 3rd gears in D3. The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the torque converter cover. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. Together with hydraulic control, the PCM optimizes the timing and volume of the lock-up mechanism. When shift solenoid valve D is turned on by the PCM, shift solenoid valve D pressure switches the lock-up shift valve lock-up on and off. A/T clutch pressure control solenoid valve C, the lock-up control valve, and the lock-up timing valve control the amount of the lock-up conditions. Shift solenoid valve D is located on the accumulator body in the transmission, and A/T clutch pressure control solenoid valve C is mounted on the transmission housing.

Gear Selection

The shift lever has five positions; P: PARK, R: REVERSE, N: NEUTRAL, D: DRIVE 1st through 5th gear range with automatic shift and sequential sportshift in M (sequential sportshift mode), and D3: DRIVE 1st through 3rd gear range with automatic shift.

SHIFT LEVER POSITIONS DESCRIPTION

Position		Description
P: PARK		Front wheels locked; park pawl engaged with park gear on secondary shaft. All clutches are released.
R: REVERSE		Reverse; reverse selector engaged with countershaft reverse gear and 5th clutch engaged.
N: NEUTRAL		All clutches are released.
D: DRIVE (1st through 5th)	Automatic shift	General driving; starts off in 1st, shifts automatically to 2nd, 3rd, 4th, then 5th, depending on vehicle speed and accelerator pedal position. Downshifts through 4th, 3rd, 2nd, and 1st on deceleration to stop. The lock-up mechanism operates in 2nd, 3rd, 4th, and 5th gears.
	M: Sequential sportshift mode	Manual gear shift driving; vehicle can start off in 1st gear, and does not upshift automatically. Vehicle can also start off in 2nd gear, and does not upshift and downshift automatically. Downshifts automatically to 1st on deceleration to stop. The lock-up mechanism operates in 2nd, 3rd, 4th, and 5th gears.
D3: DRIVE (1st through 3rd)		Used for rapid acceleration at highway speeds and general driving, up-hill and down-hill driving; starts off in 1st, shifts automatically to 2nd, then 3rd, depending on vehicle speed and accelerator pedal position. Downshifts through 2nd and 1st on deceleration to stop. The lock-up mechanism operates in 2nd and 3rd gears.

Starting is possible only in P and N because of a slide-type neutral-safety switch.

Automatic Transmission (A/T) Gear Position Indicator

The A/T gear position indicator in the gauge control module (located between speedometer and tachometer) shows which shift lever position has been selected without having look down at the console.

Shift Indicator and M indicator

2008 Acura MDX
2007-09 TRANSMISSION Automatic Transmission - MDX

When the shift lever is shifted into M (sequential sportshift mode), the M indicator next to the D indicator comes on, and the shift indicator at the bottom of the tachometer displays the gear selected.

Transfer Assembly

The transfer assembly consists of the transfer drive gear on the differential, the transfer output shaft in the transmission, the transfer drive gear (hypoid gear), the transfer shaft, the transfer output shaft (hypoid gear), and the companion flange. The transfer assembly is on the rear side of the transmission, beside the differential. The transfer drive gear on the differential drives the transfer output shaft in the transmission. The transfer output shaft in the transmission is connected to the transfer drive gear (hypoid gear) by splines. Power is transmitted from the transfer drive gear on the differential to the rear differential via the transfer assembly and the propeller shaft.

Clutches and Gears

The five-speed automatic transmission uses hydraulically-actuated clutches to engage or disengage the transmission gears. When hydraulic pressure is introduced into the clutch drum, the clutch piston moves. This presses the friction discs and steel plates together, locking them so they do not slip. Power is then transmitted through the engaged clutch pack to its hub-mounted gear. Likewise, when the hydraulic pressure is bled from the clutch pack, the piston releases the friction discs and the steel plates, and they are free to slide past each other. This allows the gear to spin independently on its shaft, transmitting no power.

Transmission Cutaway View

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Fig. 16: Identifying Transmission Cutaway View

Courtesy of AMERICAN HONDA MOTOR CO., INC.

1st Clutch

The 1st clutch engages/disengages 1st gear, and is located at the left end of the secondary shaft. The 1st clutch is supplied hydraulic pressure by its ATF feed pipe within the secondary shaft.

1st-hold Clutch

The 1st-hold clutch engages/disengages 1st-hold in 1st gear in M. The 1st-hold clutch is located in the 1st clutch drum, and is supplied hydraulic pressure by its ATF feed pipe within the secondary shaft.

2nd Clutch

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

The 2nd clutch engages/disengages 2nd gear, and is located at the right end of the secondary shaft. The 2nd clutch is supplied hydraulic pressure through the secondary shaft by a circuit connected to the internal hydraulic circuit.

3rd Clutch

The 3rd clutch engages/disengages 3rd gear, and is located at the end of the intermediary shaft. The 3rd clutch is supplied hydraulic pressure through the intermediary shaft by a circuit connected to the internal hydraulic circuit.

4th Clutch

The 4th clutch engages/disengages 4th gear, and is located at the middle of the mainshaft. The 4th clutch is joined back-to-back to the 5th clutch. The 4th clutch is supplied hydraulic pressure through the mainshaft by a circuit connected to the internal hydraulic circuit.

5th Clutch

The 5th clutch engages/disengages 5th gear, as well as reverse gear, and is located at the middle of the mainshaft. The 5th clutch is joined back-to-back to the 4th clutch. The 5th clutch is supplied hydraulic pressure through the mainshaft by a circuit connected to the internal hydraulic circuit.

One-way Clutch

The one-way clutch is positioned between the 1st clutch hub and the secondary shaft 1st gear. The secondary shaft 1st gear is splined to the 1st-hold clutch hub, with the 1st-hold clutch hub splined to the secondary shaft. The secondary shaft 1st gear provides the outer race surface, and the 1st clutch hub provides the inner race surface. The one-way clutch locks when power is transmitted from the secondary shaft 1st gear to the countershaft 1st gear. The 1st clutch and gears remain engaged in the 1st, 2nd, 3rd, 4th, and 5th gear ranges in D, and in 1st, 2nd, and 3rd gear ranges in D3.

However, the one-way clutch disengages when the 2nd, 3rd, 4th, or 5th clutches and gears are applied in D or D3. This is because the increased rotational speed of the gears on the secondary shaft causes the one-way clutch to free-wheel with the 1st clutch still engaged.

Gear operation

Gears on the mainshaft:

- 4th gear is engages/disengages with the mainshaft by the 4th clutch.
- 5th gear is engages/disengages with the mainshaft by the 5th clutch.
- Reverse gear is engaged/disengaged with the mainshaft by the 5th clutch.
- 3rd gear is splined with the mainshaft and rotates with the mainshaft.

Gears on the countershaft:

- Final gear is integral with the countershaft.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

- 1st gear, 2nd gear, and 4th gear are splined with the countershaft, and rotate with the countershaft.
- 5th gear and reverse gear rotate freely from the countershaft. The reverse selector engages 5th gear and reverse gear with the reverse selector hub. The reverse selector hub is splined to the countershaft so 5th gear and reverse gear engage with the countershaft.
- Idler gear is located over the 2nd gear, and rotates freely from the countershaft.

Gears on the secondary shaft:

- 1st gear is engaged with the secondary shaft by the 1st clutch and the one-way clutch when accelerating, and 1st gear is disengaged from the 1st clutch at the one-way clutch when decelerating. 1st gear is engaged with the secondary shaft by the 1st-hold clutch when decelerating for engine braking.
- 2nd gear is engaged/disengaged with the secondary shaft by the 2nd clutch.
- Idler gear is splined with the secondary shaft, and rotates with the secondary shaft.
- Park gear is integral with the 2nd gear.

Gears on the intermediary shaft:

- 3rd gear is engaged/disengaged with the intermediary shaft by the 3rd clutch.
- 4th gear is splined with the intermediary shaft.

Power Flow

P Position

Hydraulic pressure is not applied to the clutches. Power is not transmitted to the countershaft. The countershaft is locked by the park pawl interlocking the park gear, secondary shaft 2nd gear, and countershaft 2nd gear.

N Position

Engine power transmitted from the mainshaft drives the mainshaft 3rd gear, the intermediary shaft 3rd gear, but hydraulic pressure is not applied to the clutches. Power is not transmitted to the countershaft. In this position, the position of the reverse selector differs according to whether the shift lever shifted from D or R:

- When shifted from D, the reverse selector engages with the countershaft 5th gear and the reverse selector hub, and 5th gear engages with the countershaft.
- When shifted from R, the reverse selector engages with the countershaft reverse gear and the reverse selector hub, and the reverse gear engages with the countershaft.

Fig. 17: Power Flow Diagram (N Position)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

D and D3 Positions

In D and D3, the optimum gear is automatically selected from the 1st, 2nd, 3rd, 4th, and 5th gears in D; and 1st, 2nd, and 3rd gears in D3 according to conditions such as the balance between the throttle plate opening (engine loading) and vehicle speed.

In 1st gear

- Hydraulic pressure is applied to the 1st clutch, then the 1st clutch engages the secondary shaft 1st gear with the secondary shaft by the one-way clutch.
- The mainshaft 3rd gear drives the secondary shaft via the countershaft idler gear and secondary shaft idler gear.
- The secondary shaft 1st gear drives the countershaft 1st gear and the countershaft.

- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).

Fig. 18: Power Flow Diagram (In 1st Gear)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 2nd gear

- Hydraulic pressure is applied to the 2nd clutch, then the 2nd clutch engages the secondary shaft 2nd gear with the secondary shaft.
- The mainshaft 3rd gear drives the secondary shaft via the countershaft idler gear and secondary shaft idler gear.
- The secondary shaft 2nd gear drives the countershaft 2nd gear and the countershaft.

- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 2nd gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.

Fig. 19: Power Flow Diagram (In 2nd Gear)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 3rd gear

- Hydraulic pressure is applied to the 3rd clutch, then the 3rd clutch engages the intermediary shaft 3rd gear with the intermediary shaft.

- The mainshaft 3rd gear drives the intermediary shaft 4th gear via the intermediary shaft 3rd gear and the 3rd clutch.
- The intermediary shaft 4th gear drives the countershaft 4th gear and the countershaft via the mainshaft 4th gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 3rd gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.

Fig. 20: Power Flow Diagram (In 3rd Gear)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 4th gear

- Hydraulic pressure is applied to the 4th clutch, then the 4th clutch engages the mainshaft 4th gear with the mainshaft.
- The mainshaft 4th gear drives the countershaft 4th gear and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 4th gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.

Fig. 21: Power Flow Diagram (In 4th Gear)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 5th gear

- Hydraulic pressure is applied to the servo valve to engage the reverse selector with the countershaft 5th gear while the shift lever in D.
- Hydraulic pressure is applied to the 5th clutch, then the 5th clutch engages the mainshaft 5th gear with the mainshaft.
- The mainshaft 5th gear drives the countershaft 5th gear, which drives the reverse selector hub and the countershaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of 5th gear exceeds that of 1st gear, power from 1st gear is cut off at the one-way clutch.

Fig. 22: Power Flow Diagram (In 5th Gear)

2008 Acura MDX
2007-09 TRANSMISSION Automatic Transmission - MDX

Acceleration in 1st gear in M (sequential sportshift mode) position

In 1st gear in M (sequential sportshift mode), hydraulic pressure is applied to the 1st clutch and the 1st-hold clutch. The power flow when accelerating is as follows:

- Hydraulic pressure is applied to the 1st clutch, then the 1st clutch engages the secondary shaft 1st gear with the secondary shaft by the one-way clutch.
- The mainshaft 3rd gear drives the secondary shaft via the countershaft idler gear and secondary shaft idler gear.
- The secondary shaft 1st gear drives the countershaft 1st gear and the countershaft.
- Hydraulic pressure is also applied to the 1st-hold clutch, and the 1st-hold clutch engages the secondary shaft 1st gear with the secondary shaft.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).

Fig. 23: Power Flow Diagram (Acceleration In 1st Gear In M Position)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Deceleration in 1st gear in M (sequential sportshift mode) position

The power flow in 1st gear in M (sequential sportshift mode) when decelerating is as follows:

- Hydraulic pressure is applied to the 1st clutch and the 1st-hold clutch.
- Rolling resistance from the road surface goes through the front wheels to the final driven gear, then to the countershaft idler gear.
- The one-way clutch disengages because the application of torque is reversed.
- The force conveyed to the secondary shaft idler gear turns the mainshaft 3rd gear via the countershaft idler gear. As a result, engine braking can be obtained with 1st gear.

Fig. 24: Power Flow Diagram (Deceleration In 1st Gear In M Position)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

R Position

- Hydraulic pressure is applied to the servo valve to engage the reverse selector with the countershaft reverse gear while the shift lever is in R.
- Hydraulic pressure is applied to the 5th clutch, then the 5th clutch engages the mainshaft reverse gear with the mainshaft.
- The mainshaft reverse gear drives the countershaft reverse gear via the reverse idler gear.
- The countershaft reverse gear drives the countershaft via the reverse selector which drives the reverse selector hub.
- The rotation direction of the countershaft is changed by the reverse idler gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the transfer

drive gear.

- The transfer output shaft drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).

Fig. 25: Power Flow Diagram (R Position)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Electronic Control System

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, and seven solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions.

Functional Diagram

The PCM receives input signals from the sensors, switches, and other control units, processes data, and outputs

signals for the engine control system and A/T control system. The A/T control system includes shift control, clutch pressure control, and lock-up control. The PCM switches the shift solenoid valves and A/T clutch pressure control solenoid valves to control gear selection and lock-up torque converter clutch.

Fig. 26: Electronic Control System Functional Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Control

The PCM instantly determines which gear should be selected by various signals sent from sensors and switches, and it actuates the shift solenoid valves A, B, C, and D to control gear selection.

There are two types of shift solenoid valves:

- Shift solenoid valves A and D use the ON-OPEN/OFF-CLOSE type; the shift solenoid valve opens the port of shift solenoid valve pressure while the shift solenoid valve is turned ON by the PCM, and closes the port when shift solenoid valve is OFF.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

- Shift solenoid valves B and C use the ON-CLOSE/OFF-OPEN type; the shift solenoid valve closes the port of shift solenoid valve pressure while the shift solenoid valve is turned ON by the PCM, and opens the port when shift solenoid valve is OFF.

The combination of driving signals to shift solenoid valves A, B, C, and D are shown in the table.

GEAR POSITION AND SHIFT SOLENOID VALVES POSITION REFERENCE

Shift Control - Grade Logic Control

The grade logic control system has been adopted to control shifting in D and D3. The PCM compares actual driving conditions with memorized driving conditions, based on the input from the throttle position sensor, the engine coolant temperature sensor, the barometric pressure sensor, the brake pedal position switch signal, and the shift lever position signal, to control shifting while the vehicle is ascending or descending a slope.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Fig. 27: Grade Logic Control System Diagram

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Grade Logic Control: Ascending Control

When the PCM determines that the vehicle is climbing a hill in D and D3, the system extends the engagement area of 2nd gear, 3rd gear, and 4th gear to prevent the transmission from frequently shifting between 2nd and 3rd gears, between 3rd and 4th gears, and between 4th and 5th gears, so the vehicle can run smooth and have more power when needed.

NOTE: Shift commands stored in the PCM between 2nd and 3rd gears, between 3rd and 4th gears, and between 4th and 5th gears, enable the PCM to automatically select the most suitable gear according to the magnitude of a gradient.

Fig. 28: Throttle Opening And Vehicle Speed Graph (Grade Logic Control: Ascending Control)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Grade Logic Control: Descending Control

When the PCM determines that the vehicle is going down a hill in D and D3, the shift-up speed from 4th to 5th gear, 3rd to 4th gear, and from 2nd to 3rd (when the throttle is closed) becomes faster than the set speed for flat road driving to extend the 4th gear, 3rd gear, and 2nd gear driving areas. This, in combination with engine braking from the deceleration lock-up, achieves smooth driving when the vehicle is descending. There are three descending modes with different 4th gear driving areas, 3rd gear driving areas, and 2nd gear driving areas according to the magnitude of a gradient stored in the PCM. When the vehicle is in 5th or 4th gear and you are decelerating while applying the brakes on a steep hill, the transmission will downshift to a lower gear. When you accelerate, the transmission will then return to a higher gear.

Fig. 29: Throttle Opening And Vehicle Speed Graph (Grade Logic Control: Descending Control)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Deceleration Control

When the vehicle goes around a corner and needs to decelerate first and then accelerate, the PCM sets the data for deceleration control to reduce the number of times the transmission shifts. When the vehicle is decelerating from speeds above 25 mph (40 km/h), the PCM shifts the transmission from 4th to 3rd earlier than normal to cope with upcoming acceleration.

Shift-Hold Control

When negotiating winding roads, the throttle is suddenly released and the brakes are applied, as is the case when decelerating at the entrance of a corner, Shift-Hold Control keeps the transmission in its current (lower) ratio as it negotiates the corner and accelerates out.

When the vehicle is driven aggressively on a winding road, the PCM will extend the engagement time of 3rd gear and 4th gear to prevent the transmission from frequently shifting between 3rd, 4th, and 5th gears. This allows the driver to have more control for both acceleration and deceleration.

The PCM monitors the average change in vehicle speed and throttle overtime. When these values exceed those for normal driving conditions, the shift-up from 3rd to 4th gear and 4th to 5th gear is delayed. This gives more control over power, and engine braking when the driver is driving aggressively around winding roads. The

transmission will resume the normal shift-up pattern after the PCM determines that normal driving has resumed.

Fig. 30: Identifying Shift Pattern Of Conventional Automatic Transmission
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Control - Sequential Sportshift Mode

The MDX transmission is provided with a sequential sportshift mode in D. In D, the transmission has two shifting modes; the automatic shift mode and the sequential sportshift mode. In the automatic shift mode used for general driving, the transmission upshifts and downshifts automatically from 1st through 5th gear. In the automatic shift mode, the shift indicator and the M indicator in the gauge control module do not come on.

The transmission is switched to the sequential sportshift mode by moving the shift lever into M from the D, the automatic shift mode is canceled and the sequential sportshift mode comes into operation. The shift indicator displays the number of the selected gear, and the M indicator comes on. In the sequential sportshift mode, the driver can shift up and down manually from 1st through 5th gear by using the shift lever, much like a manual transmission, and the transmission must be shifted up and down by using the shift lever. However, the transmission cannot downshift and stays in the current gear if the shift lever is pulled while the vehicle is coasting at a speed that would cause the engine to over-rev by downshifting the transmission, and the shift indicator blinks the number of the selected gear several times, then returns to the number of the current gear. If the vehicle speed reaches an appropriate speed while the shift indicator is blinking the number of the selected gear, the transmission downshifts and the shift indicator displays the selected gear. The transmission also cannot upshift and stay in the current gear if the shift lever is pushed while driving below an appropriate upshifting speed, the shift indicator blinks the number of the selected gear several times, then returns to the number of the current gear. If the vehicle speed reaches an appropriate upshift speed while the shift indicator is blinking the number of the selected gear, the transmission upshifts and the shift indicator displays the selected gear.

When the transmission decelerates to a stop, the transmission shifts to 1st gear automatically. The transmission can be shifted to 2nd gear by pushing the shift lever while the vehicle is stopped, and the vehicle can start off in 2nd gear. The sequential sportshift mode is canceled when moving the shift lever to any position other than M.

Fig. 31: Moving Shift Lever

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Pressure Control

The PCM actuates A/T clutch pressure control solenoid valves A, B, and C to control the clutch pressure. When shifting between gears, the clutch pressure regulated by A/T clutch pressure control solenoid valves A, B, and C engages and disengages the clutch smoothly.

The PCM receives input signals from the various sensors and switches, performs processing data, and outputs current to A/T clutch pressure control solenoid valves A, B, and C.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Fig. 32: Clutch Pressure Control System Diagram

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Lock-up Control

Shift solenoid valve D controls the hydraulic pressure to switch the lock-up shift valve and lock-up ON and OFF. The PCM actuates shift solenoid valve D and A/T clutch pressure control solenoid valve C ON, the condition of lock-up starts. A/T clutch pressure control solenoid valve C regulates and applies hydraulic pressure to the lock-up control valve to control the volume of the lock-up.

The lock-up mechanism operates in 2nd, 3rd, 4th, and 5th gears in D, and in 2nd and 3rd gears in D3.

Hydraulic Controls

The valve body includes the main valve body, the regulator valve body, the secondary valve body, and the accumulator body. The ATF pump is driven by splines on the end of the torque converter which is attached to the engine. Fluid flows through the regulator valve to maintain specified pressure through the main valve body to the manual valve, directing pressure to each of the clutches. Shift solenoid valves A, B, C, and D are mounted on the accumulator body. A/T clutch pressure control solenoid valves A, B, and C are mounted on the transmission housing.

Fig. 37: Identifying Valve Body Components

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Main Valve Body

The main valve body contains the manual valve, the modulator valve, the torque converter check valve, shift valve A, shift valve B, shift valve D, shift valve E, CPC valve C, the relief valve, the lock-up shift valve, the lock-up timing valve, the lubrication control valve, the lubrication check valve, and the ATF pump gears. The primary function of the main valve body is to switch fluid pressure on and off to control hydraulic pressure going to the hydraulic control system.

Fig. 38: Identifying Main Valve Body Components
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Regulator Valve Body

The regulator valve body is located on the main valve body. The regulator valve body contains the regulator valve, the cooler check valve, the lock-up control valve, the servo valve, and the 3rd accumulator.

Fig. 39: Identifying Regulator Valve Body Components
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Regulator Valve

The regulator valve maintains constant hydraulic pressure from the ATF pump to the hydraulic control system, while also furnishing fluid to the lubrication system and torque converter. Fluid from the ATF pump flows through B and B'. Fluid entering from B flows through the valve orifice to the A cavity. This pressure of the A cavity pushes the regulator valve to the spring side, and this movement of the regulator valve uncovers the fluid port to the torque converter and the relief valve. The fluid flows out to the torque converter and the relief valve.

and the regulator valve returns under spring force. According to the level of the hydraulic pressure through B, the position of the regulator valve changes, and the amount of fluid from B' through the torque converter changes. This operation is continued, maintaining the line pressure.

Fig. 40: Regulator Valve Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Increases in hydraulic pressure according to torque are regulated by the regulator valve using stator torque reaction. The stator shaft is splined to the stator in the torque converter, and its arm end contacts the regulator spring cap. When the vehicle is accelerating or climbing (torque converter range), stator torque reaction acts on the stator shaft, and the stator arm pushes the regulator spring cap in the direction of the arrow in proportion to the reaction. The stator reaction spring compresses, and the regulator valve moves to increase the line pressure which is regulated by the regulator valve. The line pressure reaches its maximum when the stator torque reaction reaches its maximum.

Fig. 41: Identifying Regulator Spring Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The secondary valve body is on the main valve body. The secondary valve body contains shift valve C, shift valve D, CPC valve B, CPC valve C, the reverse control valve, and the reverse CPC valve.

Fig. 42: Identifying Secondary Valve Body Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Accumulator Body

The accumulator body is on the secondary valve body, and contains the 1st, 1st-hold, 2nd, 4th, and 5th accumulators. The 3rd accumulator is in the regulator valve body.

Fig. 43: Identifying Accumulator Body Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Hydraulic Flow

Distribution of Hydraulic Pressure

As the engine turns, the ATF pump starts to operate. Automatic transmission fluid (ATF) is drawn through the

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

ATF strainer (filter) and discharged into the hydraulic circuit. Then, ATF flowing from the ATF pump becomes line pressure that is regulated by the regulator valve. Torque converter pressure from the regulator valve enters the torque converter through the lock-up shift valve and lock-up control valve, and it is discharged from the torque converter. The torque converter check valve prevents torque converter pressure from rising.

The PCM controls shift solenoid valves A, B, C, and D ON and OFF, and the shift solenoid valves control shift solenoid pressure to the shift valves. Applying shift solenoid pressure to the shift valves moves the position of the shift valve, and switches the port of hydraulic pressure. The PCM also controls A/T clutch pressure control solenoid valves A, B, and C. The A/T clutch pressure control solenoid valves regulate hydraulic pressure, and apply the pressure to CPC valves A and B, and reverse CPC valve.

When shifting between gears, the clutch is engaged by pressure from the CPC pressure mode. The PCM controls one of the shift solenoid valves to move the position of the shift valve. This movement switches the port of CPC pressure and line pressure. Line pressure is then applied to the clutch, and CPC pressure is released. Engaging the clutch with line pressure mode happens when shifting is completed.

Hydraulic Pressure at the Port for use in the hydraulic circuit:

N Position

Line pressure (1) regulated by the regulator valve flows to shift solenoid valves. The PCM controls the shift solenoid valves ON and OFF. The conditions of the shift solenoid valves and the positions of the shift valves are as follows:

- Shift solenoid valve A is OFF, and closes the port of shift solenoid valve A pressure (SA); shift valve A stays on the left side.
- Shift solenoid valve B is turned ON, and closes the port of shift solenoid valve B pressure (SB); shift valve B and shift valve E stay on the left side.
- Shift solenoid valve C is OFF, and opens the port of shift solenoid valve C pressure (SC); shift valve C and shift valve D move to the right side.
- Shift solenoid valve D is OFF, and closes the port of shift solenoid valve D pressure (SD).

Line pressure (1) also flows to the modulator valve and becomes modulator pressure (6). Modulator pressure (6) flows to the A/T clutch pressure control solenoid valves. The manual valve covers the port leading pressure to the clutches, and hydraulic pressure is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 44: Hydraulic Flow Diagram (N Position)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

D and D3 Positions: 1st gear shifting from the N position

When shifting to D or M from N, the condition of the shift solenoid valves remain the same as in N. The manual valve is moved to D, and uncovers the port of line pressure (4) leading to CPC valves A and C. The PCM controls A/T clutch pressure control solenoid valves A and C, A/T clutch pressure control solenoid valve A pressure (56) flows to the CPC valve A, and A/T clutch pressure control solenoid valve C pressure (58) flows to the CPC valve C. CPC valves A and C regulate line pressure (4), line pressure (4) becomes CPC C pressure (4C) at the CPC valve C, and becomes CPC A pressure at CPC valve A. CPC C pressure (4C) becomes 1st clutch pressure (10) at shift valve D, and 1st clutch pressure flows to the 1st clutch. CPC A pressure (4A) becomes 2nd clutch pressure (20) at shift valve B via shift valves A and C. The 1st clutch and 2nd clutch engage gently with the CPC pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 45: Hydraulic Flow Diagram (D And D3 Positions: 1st Gear Shifting From N Position)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

D and D3 Positions: Driving in 1st gear

The PCM turns shift solenoid valve C ON, and shift solenoid valve C covers the port of shift solenoid valve C pressure (SC) to shift valve C, and shift valve D via shift valve E. Shift solenoid valve A remains OFF, and shift solenoid valve B remains ON. Shift valves C and D are moved to the left side, shift valve D switches the port of line pressure (4) and CPC C pressure (4C) leading to the 1st clutch, and shift valve C switches the port of CPC A pressure (5A) releasing 2nd clutch pressure. Line pressure (4) becomes 1st clutch pressure (10) at shift valve D, and flows to the 1st clutch. The 1st clutch is engaged securely with the line pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 46: Hydraulic Flow Diagram (D And D3 Positions: Driving In 1st Gear)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

D and D3 Positions: Shifting between 1st gear and 2nd gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A ON, and shift solenoid valve A uncovers the port of shift solenoid valve A pressure (SA) to shift valve A. Shift solenoid valves B and C remain ON. Shift valve A is moved to the right side to uncover the port of CPC A pressure (4A) leading to the 2nd clutch. The PCM controls A/T clutch pressure control solenoid valve A, and A/T clutch pressure control solenoid valve A pressure (56) is applied to CPC valve A. CPC valve A regulates line pressure (4), and line pressure (4) becomes CPC A pressure (4A). CPC A pressure (4A) flows to shift valve B via shift valves C and A, and becomes 2nd clutch pressure (20) at shift valve B. The 2nd clutch is engaged in the CPC pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

D and D3 Positions: Shifting between 2nd gear and 3rd gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve C ON, and shift solenoid valve C covers the port of shift solenoid valve C pressure (SC) to shift valve C. Shift solenoid valves A and B remain ON. Shift valve C is moved to the left side to switch the port of line pressure (4) and CPC A pressure (4A) leading to the 2nd clutch. Shift valve C also uncovers the port of CPC B pressure (4B) leading to the 3rd clutch. The PCM controls A/T clutch pressure control solenoid valves A and B. A/T clutch pressure control solenoid valve A pressure (56) is applied to CPC valve A, and A/T clutch pressure control solenoid valve B pressure (57) is applied to CPC valve B. CPC valve B regulates line pressure (4"), and line pressure (4") becomes CPC B pressure (4B). CPC B pressure flows to shift valve A via shift valves C and B, and becomes 3rd clutch pressure (30) at shift valve A. The 2nd clutch pressure (20) is changed to CPC pressure mode, and the 3rd clutch is engaged with the CPC pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

2008 Acura MDX

The PCM turns shift solenoid valve B OFF, and shift solenoid valve B uncovers the port of shift solenoid valve B pressure (SB) to shift valve B. Shift solenoid valves A and C remain ON. Shift valve B is moved to the right side to switch the port of line pressure (5C), CPC B pressure (5J) leading to the 3rd clutch, and 2nd clutch pressure (20) releasing 2nd clutch pressure. CPC B pressure (5J) changes to line pressure (5J) and 3rd clutch pressure (30) is changed to line pressure mode, and the 3rd clutch is engaged with the line pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 50: Hydraulic Flow Diagram (D And D3 Positions: Driving In 3rd Gear)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

D Position: Shifting between 3rd gear and 4th gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve C OFF, and shift solenoid valve C uncovers the port of shift solenoid valve C pressure (SC) to shift valve C. Shift solenoid valve A remains ON, and shift solenoid valve B remains OFF. Shift valve C is moved to the right side to switch the port of line pressure (4) and CPC B pressure (4B) leading to the 3rd clutch. Shift valve C also uncovers the port of CPC A pressure (4A) leading to the 4th clutch. The PCM controls A/T clutch pressure control solenoid valves A and B. A/T clutch pressure control solenoid valve A pressure (56) is applied to the CPC valve A, and A/T clutch pressure control solenoid valve B pressure (57) is applied to CPC valve B. CPC valve A regulates line pressure (4), and line pressure (4) becomes CPC A pressure (4A). CPC A pressure (4A) flows to shift valve B via shift valves C and A, and becomes 4th clutch pressure (40) at shift valve B. The 3rd clutch pressure (30) is changed to CPC pressure mode, and the 4th clutch is engaged in the CPC pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 51: Hydraulic Flow Diagram (D Position: Shifting Between 3rd Gear And 4th Gear)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

D Position: Driving in 4th gear

The PCM turns shift solenoid valve A OFF, and shift solenoid valve A covers the port of shift solenoid valve A pressure (SA) to the shift valve A. Shift solenoid valves B and C remain OFF. The shift valve A is moved to the left side to switch the port of pressure (5B), CPC A pressure (5A) (5L) leading to the 4th clutch, and 3rd clutch pressure (30) releasing 3rd clutch pressure. CPC A pressure (5L) changes to line pressure (5L) and 4th clutch pressure (40) is changed to line pressure mode, and the 4th clutch is engaged with the line pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 52: Hydraulic Flow Diagram (D Position: Driving In 4th Gear)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

D Position: Shifting between 4th gear and 5th gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve C ON, and shift solenoid valve C covers the port of shift solenoid valve C pressure (SC) to shift valve C. Shift solenoid valve A remains OFF, and shift solenoid valve B remains OFF. Shift valve C is moved to the left side to switch the port of line pressure (4) and CPC A pressure (4A) leading to the 4th clutch. Shift valve C also uncovers the port of CPC B pressure (4B) leading to the 5th clutch. The PCM controls A/T clutch pressure control solenoid valves A and B. A/T clutch pressure control solenoid valve A pressure (56) is applied to the CPC valve A, and A/T clutch pressure control solenoid valve B pressure (57) is applied to CPC valve B. CPC valve B regulates line pressure (4"), and line pressure (4") becomes CPC B pressure (4B). CPC B pressure (4B) flows to shift valve A via shift valves C and B, and becomes 5th clutch pressure (51) at shift valve A. The 4th clutch pressure (40) is changed to CPC pressure mode, and the 5th clutch is engaged in the CPC pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 53: Hydraulic Flow Diagram (D Position: Shifting Between 4th Gear And 5th Gear)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

D Position: Driving in 5th gear

The PCM turns shift solenoid valve B ON, and shift solenoid valve B covers the port of shift solenoid valve B pressure (SB) to shift valve B. Shift solenoid valve A remains OFF, and shift solenoid valve C remains ON. Shift valve B is moved to the left side to switch the port of line pressure (5H), CPC B pressure (5D) leading to the 5th clutch, and 4th clutch pressure (40) releasing 4th clutch pressure. CPC B pressure (5H) changes to line pressure (5H) and 5th clutch pressure (51) (50) is changed to line pressure mode, and the 5th clutch is engaged in the line pressure mode. The 1st clutch is also engaged, but no power is transmitted because of the one-way clutch.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 54: Hydraulic Flow Diagram (D Position: Driving In 5th Gear)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 1st gear (engaged with 1st and 1st-hold clutches) in the sequential sport shift mode

Line pressure (1) regulated by the regulator valve flows to shift solenoid valves. The PCM controls the shift solenoid valves ON and OFF. The conditions of the shift solenoid valves and the positions of the shift valves are as follows:

- Shift solenoid valve A is OFF, and closes the port of shift solenoid valve A pressure (SA); shift valve A stays on the left side.
- Shift solenoid valve B is turned ON, and closes the port of shift solenoid valve B pressure (SB); shift valve B and shift valve E stay on the left side.
- Shift solenoid valve C is turned ON, and closes the port of shift solenoid valve C pressure (SC); shift valve C and shift valve D stay on the left side.
- Shift solenoid valve D is OFF, and closes the port of shift solenoid valve D pressure (SD).

Line pressure (4) becomes 1st clutch pressure (10) at shift valve D, and flows to the 1st clutch. The 1st clutch is engaged. The PCM controls A/T clutch pressure control solenoid valve C, and A/T clutch pressure control solenoid valve C pressure (58) is applied to CPC valve C via the lock-up shift valve. CPC valve C regulates line pressure (4), and line pressure (4) becomes CPC C pressure (4C). CPC C pressure (4C) flows to shift valve B via shift valves D, E, and C, and becomes 1st-hold clutch pressure (15) at shift valve B. 1st-hold clutch pressure

(15) is applied to the 1st-hold clutch, and the 1st-hold clutch is engaged.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 55: Hydraulic Flow Diagram (Driving In 1st Gear In Sequential Sport Shift Mode)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

R Position: Shifting to the R position from the P or N position

The PCM controls the shift solenoid valves ON and OFF. The conditions of the shift solenoid valves and the positions of the shift valves are as follows:

- Shift solenoid valve A is OFF, and closes the port of shift solenoid valve A pressure (SA); shift valve A stays on the leftside.
- Shift solenoid valve B is turned ON, and closes the port of shift solenoid valve B pressure (SB); shift valve B and shift valve E stay on the left side.
- Shift solenoid valve C is OFF, and opens the port of shift solenoid valve C pressure (SC); shift valve C and shift valve D move to the right side.
- Shift solenoid valve D is turned ON, and opens the port of shift solenoid valve D pressure (SD); reverse control valve moves to the right side.

The manual valve is moved to R, and line pressure (1) becomes line pressure (3) at the manual valve. Line

pressure (3) passes through the reverse control valve, and becomes line pressure (3A), then flows to the servo valve. Line pressure (3A) pushes the servo valve to the reverse position. Line pressure (3) also flows to the reverse CPC valve, and becomes reverse CPC pressure (3B) (3"). Reverse CPC pressure (3") becomes 5th clutch pressure (50) at the manual valve, and 5th clutch pressure (50) flows to the 5th clutch. The 5th clutch is engaged with reverse CPC pressure mode.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 56: Hydraulic Flow Diagram (R Position: Shifting To R Position From P Or N Position)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

R Position: Driving in reverse gear

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve A ON, and shift solenoid valve A uncovers the port of shift solenoid valve A pressure (SA) to shift valve A. Shift valve A is moved to the right side to switch the port of line pressure (3') and reverse CPC pressure (3B) leading to the 5th clutch. Line pressure (3) flows to the manual valve via the servo valve and shift valve A, and becomes 5th clutch pressure (50) at the manual valve. The 5th clutch pressure (50) flows to the 5th clutch, and the 5th clutch is engaged with the line pressure mode.

Reverse Inhibitor Control

When R is selected while the vehicle is moving forward at a speed over 6 mph (10 km/h), the PCM commands shift solenoid valve D to remain OFF so that shift solenoid valve D pressure (SD) is not applied to the reverse control valve. Line pressure (3) stops at the reverse control valve, and is not applied to the servo valve. No power is transmitted to the reverse direction.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 57: Hydraulic Flow Diagram (R Position: Driving In Reverse Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

P Position

The PCM controls the shift solenoid valves ON and OFF. The conditions of the shift solenoid valves and the positions of the shift valves are as follows:

- Shift solenoid valve A is OFF, and closes the port of shift solenoid valve A pressure (SA); shift valve A stays on the leftside.
- Shift solenoid valve B is turned ON, and closes the port of shift solenoid valve B pressure (SB); shift valve B and shift valve E stay on the left side.
- Shift solenoid valve C is OFF, and opens the port of shift solenoid valve C pressure (SC); shift valve C and shift valve D move to the right side.
- Shift solenoid valve D is turned ON, and opens the port of shift solenoid valve D pressure (SD); reverse

control valve moves to the right side.

The manual valve is moved to the P position, and line pressure (1) becomes line pressure (3) at the manual valve. Line pressure (3) passes through the reverse control valve, and becomes line pressure (3A), then flows to the servo valve. Line pressure (3A) pushes the servo valve to the reverse position. Line pressure (3) flows to the manual valve via the reverse CPC valve and shift valve A, and stops at the manual valve. Hydraulic pressure is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 58: Hydraulic Flow Diagram (P Position)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Lock-up System

The lock-up mechanism of the torque converter clutch operates in 2nd, 3rd, 4th, and 5th gears in D, and in 2nd and 3rd gears in D3. The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the torque converter cover. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. Together with the hydraulic control, the PCM optimizes the timing and amount of the lock-up mechanism. When shift solenoid valve D is turned on by the PCM, shift solenoid valve D pressure switches the lock-up shift valve lock-up on and off. A/T clutch pressure control solenoid valve C, the lock-up control valve, and lock-up timing valve control the amount of

lock-up.

Torque Converter Clutch Lock-up ON (Engaging Torque Converter Clutch)

Fluid in the chamber between the torque converter cover and the torque converter clutch piston is drained off, and fluid entering from the chamber between the pump and stator exerts pressure through the torque converter clutch piston against the torque converter cover. The torque converter clutch piston engages with the torque converter cover; the torque converter clutch lock-up is ON, and the mainshaft rotates at the same speed as the engine.

Fig. 59: Power Flow Diagram (Torque Converter Clutch Lock-Up On (Engaging Torque Converter Clutch))

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Torque Converter Clutch Lock-up OFF (Disengaging Torque Converter Clutch)

Fluid entered from the chamber between the torque converter cover and the torque converter clutch piston passes through the torque converter and goes out from the chambers between the turbine and the stator, and between the pump and the stator. As a result, the torque converter clutch piston moves away from the torque converter cover, and the torque converter clutch lock-up is released; the torque converter clutch lock-up is OFF.

Fig. 60: Power Flow Diagram (Torque Converter Clutch Lock-Up Off (Disengaging Torque Converter Clutch))

Courtesy of AMERICAN HONDA MOTOR CO., INC.

No Lock-up

The PCM commands shift solenoid valve D to remain OFF, and shift solenoid valve D covers the port of shift solenoid valve D pressure (SD) to the lock-up shift valve. The lock-up shift valve is in the right side, and uncovers the torque converter pressure port (92) leading to the left side of the torque converter. Torque converter pressure (92) from regulator valve becomes torque converter pressure (94) at the lock-up shift valve, and enters into the left side of the torque converter to disengage the torque converter clutch. The torque converter clutch is OFF.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 61: Lock-Up System Diagram (No Lock-Up)
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Partial Lock-up

As the speed of the vehicle reaches the programmed value, the PCM turns shift solenoid valve D ON, and shift

solenoid valve D uncovers the port of shift solenoid valve D pressure (SD) to the lock-up shift valve. The lock-up shift valve is moved to the left side to uncover the torque converter pressure port (91) leading to the right side of the torque converter to engage the torque converter clutch. The PCM also controls A/T clutch pressure control solenoid valve C, and A/T clutch pressure control solenoid valve C pressure (58) is applied to the lock-up control valve and lock-up timing valve. When A/T clutch pressure control solenoid valve C pressure (58) is low, torque converter pressure (91) from the lock-up timing valve is low. The torque converter clutch is engaged partially. A/T clutch pressure control solenoid valve C pressure (58) increases, and the lock-up timing valve is moved to the left side to uncover the port leading torque converter pressure to high. Under this condition, the torque converter clutch is engaged by pressure from the right side of the torque converter; this condition is partial lock-up.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 62: Lock-Up System Diagram (Partial Lock-Up)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Full Lock-up

When the vehicle speed further increases, the PCM controls A/T clutch pressure control solenoid valve C to

increase A/T clutch pressure control solenoid valve C pressure (58). A/T clutch pressure control solenoid valve C pressure (58) is applied to the lock-up control valve and lock-up timing valve, and the lock-up control valve and lock-up timing valve are moved to the left side. Torque converter pressure (94) from the left side of the torque converter releases at the lock-up control valve, and lock-up timing valve uncovers the port of torque converter pressure (91) leading to the right side of the torque converter. Torque converter back pressure is released fully, and torque converter clutch is engaged fully. :

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

Fig. 63: Lock-Up System Diagram (Full Lock-Up)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Lever Mechanism

The shift lever has five positions; P, R, N, D, and D3. D has two modes; automatic shift mode and sequential sportshift mode with the shift lever moved to M. The shift lever shifts out of P by holding in the shift lever button, and moving the shift lever into any available gears. The shift lever is engaged with the shift lever link in P, R, N, D, and D3. This unit shifts the transmission using the shift cable connected between the shift lever link and the transmission control shaft.

In M, the shift lever is disengaged from the shift lever link, and the shift lever can be used to shift gears manually between 1st through 5th, much like a manual transmission.

Fig. 64: Identifying Shift Lever Mechanism Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Lever Mechanism in M Position

When the shift lever shifts to M, the shift lever is disengaged from the shift lever link/shift lever pivot. The shift lever link lock pops up to engage with the shift lever bracket base; the shift lever link and the transmission are held in D. The shift lever link lock is spring loaded, it pops up in M, and does not engage the shift lever link in any position except M.

Fig. 65: Pushing Shift Lever Link Lock

Courtesy of AMERICAN HONDA MOTOR CO., INC.

The shift lever fits into M by using a detent plunger with a spring. When shifting to upshift and downshift position, the detent plunger is depressed by the detent bracket wall, and detent plunger spring puts the shift lever back into the neutral position. The detent plunger also works in P.

DTC TROUBLESHOOTING

DTC P0107: Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and

review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), then turn it ON (II) again.
3. Check whether DTC P0107 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0107 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0107 in the PGM-FI System (see **DTC P0107: MAP SENSOR CIRCUIT LOW VOLTAGE**).

NO - Go to step 4.

4. Check whether DTC P0107 is indicated in the DTCs/ Freeze Data in A/t Mode Menu with the HDS.

Is DTC P0107 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Turn the ignition switch to LOCK (0), then turn it ON (II).
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0107 indicated?

YES - Check for poor connections and loose terminals at the MAP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0107 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the MAP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE**

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

THE PCM), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0108: Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to LOCK (0), then turn it ON (II) again.
3. Check whether DTC P0108 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0108 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0108 in the PGM-FI System (see **DTC P0108: MAP SENSOR CIRCUIT HIGH VOLTAGE**).

NO - Go to step 4.

4. Check whether DTC P0108 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0108 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Turn the ignition switch to LOCK (0), then turn it ON (II).
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0108 indicated?

YES - Check for poor connections and loose terminals at the MAP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0108 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the MAP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0335: Crankshaft Position (CKP) Sensor A No Signal

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check whether DTC P0335 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0335 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0335 in the PGM-FI System (see **DTC P0335: CKP SENSOR A NO SIGNAL; DTC P0385: CKP SENSOR B NO SIGNAL**).

NO - Go to step 4.

4. Check whether DTC P0335 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0335 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0335 indicated?

YES - Check for poor connections and loose terminals at the CKP sensor A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

8. Monitor the OBD STATUS for P0335 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO -If the HDS indicates FAILED, check for poor connections and loose terminals at the CKP sensor A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0339: Crankshaft Position (CKP) Sensor A Intermittent Interruption

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine, and let it idle for 10 seconds.
3. Check whether DTC P0339 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0339 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0339 in the PGM-FI System (see **DTC P0339: CKP SENSOR A INTERMITTENT INTERRUPTION; DTC P0389: CKP SENSOR B INTERMITTENT INTERRUPTION**).

NO - Go to step 4.

4. Check whether DTC P0339 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0339 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and let it idle for 10 seconds.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0339 indicated?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Check for poor connections and loose terminals at the CKP sensor A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0339 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the CKP sensor A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0340: Camshaft Position (CMP) Sensor No signal

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check whether DTC P0340 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0340 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0340 in the PGM-FI System (see **DTC P0340: CMP SENSOR NO SIGNAL**).

NO - Go to step 4.

4. Check whether DTC P0340 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0340 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

6. Start the engine.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0340 indicated?

YES - Check for poor connections and loose terminals at the CMP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0340 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the CMP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0344: Camshaft Position (CMP) Sensor Intermittent Interruption

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine, and let it idle for 10 seconds.
3. Check whether DTC P0344 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0344 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0344 in the PGM-FI System (see **DTC P0344: CMP SENSOR CIRCUIT INTERMITTENT INTERRUPTION**).

NO - Go to step 4.

4. Check whether DTC P0344 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0344 indicated?

YES - Go to step 5

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and let it idle for 10 seconds.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0344 indicated?

YES - Check for poor connections and loose terminals at the CMP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0344 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the CMP sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0385: Crankshaft Position (CKP) Sensor B No signal

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check whether DTC P0385 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0385 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0385 in the PGM-FI System (see **DTC P0335: CKP SENSOR A NO SIGNAL; DTC P0385: CKP SENSOR B NO SIGNAL**).

NO - Go to step 4.

4. Check whether DTC P0385 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is DTC P0385 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0385 indicated?

YES - Check for poor connections and loose terminals at the CKP sensor B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0385 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the CKP sensor B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0389: Crankshaft Position (CKP) Sensor B Intermittent Interruption

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine, and let it idle for 10 seconds.
3. Check whether DTC P0389 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P0389 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P0389 in the PGM-FI System (see **DTC P0339: CKP SENSOR A INTERMITTENT INTERRUPTION; DTC P0389: CKP SENSOR B INTERMITTENT**

INTERRUPTION).

NO - Go to step 4.

4. Check whether DTC P0389 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0389 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and let it idle for 10 seconds.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0389 indicated?

YES - Check for poor connections and loose terminals at the CKP sensor Band the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P0389 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the CKP sensor B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P062F: Powertrain Control Module (PCM) Internal Control Module Keep Alive Memory (KAM) Error

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Check whether DTC P062F is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is DTC P062F indicated in the PGM-FI system?

YES - Troubleshoot for DTC P062F in the PGM-FI System (see **DTC P062F: PCM INTERNAL CONTROL MODULE KEEP ALIVE MEMORY (KAM) ERROR**).

NO - Go to step 3.

3. Check whether DTC P062F is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P062F indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time.

4. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
5. Start the engine, and let it run for at least 2 minutes.
6. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P062F indicated?

YES - Check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 7.

7. Monitor the OBD STATUS for P062F in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 6, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0705: Short in Transmission Range Switch Circuit (Multiple Shift-position Input)

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Clear the DTC with the HDS.
2. Start the engine.
3. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position, and monitor the OBD STATUS for P0705 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for an intermittent short in the wire between the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 2 and recheck.

4. Turn the ignition switch to LOCK (0).
5. Inspect the transmission range switch (see TRANSMISSION RANGE SWITCH TEST).

Is the switch OK?

YES - With the switch connector disconnected, go to step 6.

NO - Replace the transmission range switch (see TRANSMISSION RANGE SWITCH REPLACEMENT), then go to step 49.

6. Turn the ignition switch to ON (II).
7. Measure the voltage between transmission range switch connector terminals No. 4 and No. 5.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 69: Identifying Voltage Between Transmission Range Switch Connector Terminals No 4 And 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Go to step 8.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector A (49P).
11. Check for continuity between the PCM connector terminal A16 and the body ground.

PCM CONNECTOR A (49P)

Terminal side of female terminals

Fig. 70: Identifying Continuity Between PCM Connector Terminal A16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal A16 and the transmission range switch, then go to step 49.

NO - Go to step 12.

12. Check for continuity between transmission range switch connector terminal No. 5 and body ground.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 71: Identifying Continuity Between Transmission Range Switch Connector Terminal No 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 43.

NO - Repair open in the wire between transmission range switch connector terminal No. 6 and ground (G101), or repair poor ground (G101), then go to step 49.

13. Measure the voltage between transmission range switch connector terminals No. 3 and No. 5.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 72: Identifying Voltage Between Transmission Range Switch Connector Terminals No 3 And No 5

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Go to step 14.

14. Turn the ignition switch to LOCK (0).
15. Jump the SCS line with the HDS.
16. Disconnect PCM connector C (49P).
17. Check for continuity between PCM connector terminal C25 and body ground.

PCM CONNECTOR C (49P)

Terminal side of female terminals

Fig. 73: Identifying Continuity Between PCM Connector Terminal C25 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C25 and the transmission range switch, then go to step 49.

NO - Go to step 43.

18. Measure the voltage between transmission range switch connector terminals No. 5 and No. 8.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 74: Identifying Voltage Between Transmission Range Switch Connector Terminals No 5 And No 8

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 23.

NO - Go to step 19.

19. Turn the ignition switch to LOCK (0).
20. Jump the SCS line with the HDS.
21. Disconnect PCM connector C (49P).
22. Check for continuity between PCM connector terminal C26 and body ground.

PCM CONNECTOR C (49P)

Terminal side of female terminals

Fig. 75: Identifying Continuity Between PCM Connector Terminal C26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C26 and the transmission range switch, then go to step 49.

NO - Go to step 43.

23. Measure the voltage between transmission range switch connector terminals No. 2 and No. 5.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 76: Identifying Voltage Between Transmission Range Switch Connector Terminals No 2 And No 5

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 28.

NO - Go to step 24.

24. Turn the ignition switch to LOCK (0).
25. Jump the SCS line with the HDS.

26. Disconnect PCM connector C (49P).
27. Check for continuity between PCM connector terminal C17 and body ground.

Terminal side of female terminals

Fig. 77: Identifying Continuity Between PCM Connector Terminal C17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C17 and the transmission range switch, then go to step 49.

NO - Go to step 43.

28. Measure the voltage between transmission range switch connector terminals No. 5 and No. 7.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 78: Identifying Voltage Between Transmission Range Switch Connector Terminals No 5 And No 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 32.

NO - Go to step 29.

29. Turn the ignition switch to LOCK (0).
30. Jump the SCS line with the HDS.
31. Disconnect PCM connector C (49P).
32. Check for continuity between PCM connector terminal C46 and body ground.

PCM CONNECTOR C (49P)

Terminal side of female terminals

Fig. 79: Identifying Continuity Between PCM Connector Terminal C46 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C46 and the transmission range switch, then go to step 49.

NO - Go to step 43.

33. Measure the voltage between transmission range switch connector terminals No. 5 and No. 6.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 80: Identifying Voltage Between Transmission Range Switch Connector Terminals No 5 And No 6
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 38.

NO - Go to step 34.

34. Turn the ignition switch to LOCK (0).
35. Jump the SCS line with the HDS.
36. Disconnect PCM connector C (49P).
37. Check for continuity between PCM connector terminal C18 and body ground.

Terminal side of female terminals

Fig. 81: Identifying Continuity Between PCM Connector Terminal C18 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C18 and the transmission range switch, then go to step 49.

NO - Go to step 43.

38. Measure the voltage between transmission range switch connector terminals No. 5 and No. 9.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 82: Identifying Voltage Between Transmission Range Switch Connector Terminals No 5 And No 9
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 43.

NO - Go to step 39.

39. Turn the ignition switch to LOCK (0).
40. Jump the SCS line with the HDS.
41. Disconnect PCM connector C (49P).
42. Check for continuity between PCM connector terminal C19 and body ground.

Fig. 83: Identifying Continuity Between PCM Connector Terminal C19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C19 and the transmission range switch, then go to step 49.

NO - Go to step 43.

43. Reconnect all connectors.
44. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
45. Start the engine.
46. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
47. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0705 indicated?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Go to step 48.

48. Monitor the OBD STATUS for P0705 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 47, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 45 and recheck.

49. Clear the DTC with the HDS.
50. Start the engine.
51. With the brake pedal pressed, move the shift lever through all positions. Stop for at least 1 second in each position.
52. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0705 indicated?

YES - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then return to step 49 and recheck.

NO - Go to step 53.

53. Monitor the OBD STATUS for P0705 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 52, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to the step 50 and recheck.

DTC P0706: Open in Transmission Range Switch Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused

by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Clear the DTC with the HDS.
3. Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.
4. Start the engine, disable the VSA by pressing the VSA OFF switch, run the vehicle in D until the vehicle speed reaches 30 mph (48 km/h), then slow down and stop the wheels.
5. Monitor the OBD STATUS for P0706 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 6

NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

6. Turn the ignition switch to LOCK (0).
7. Inspect the transmission range switch.

Is the switch OK?

YES - Go to step 8.

NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 27.

8. Shift to D, and check the Forward Switch (ATPFWD) and A/T D Switch inputs with the HDS in the A/T data list.

Is the Forward Switch (ATPFWD) and the A/T D Switch ON?

YES - Go to step 9.

NO - Go to step 13.

9. Shift to D3, and check the Forward Switch (ATPFWD) and A/T D3 Switch inputs with the HDS in the A/T data list.

Is the Forward Switch (ATPFWD) and the A/T D3 Switch ON?

YES - Go to step 10.

NO - Go to step 13.

10. Clear the DTC with the HDS.
11. Start the engine, and turn the VSA off (the light on the VSA OFF switch comes on). Run the engine in D until the vehicle speed reaches 30 mph (48 km/h), then slow down and stop the wheels.
12. Monitor the OBD STATUS for P0706 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 13.

NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmission range switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

13. Turn the ignition switch to LOCK(0).
14. Disconnect the transmission range switch connector.
15. Check for continuity between transmission range switch connector terminal No. 6 and body ground.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 84: Identifying Continuity Between Transmission Range Switch Connector Terminals No. 6 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 16

NO - Repair open in the wire between the transmission range switch and ground (G101), or repair poor ground (G101), then go to step 27.

16. Turn the ignition switch to ON (II).
17. Measure the voltage between transmission range switch connector terminals No. 5 and No. 6.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 85: Measuring Voltage Between Transmission Range Switch Connector Terminal No. 5 And No 6.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Go to step 18

NO - Repair open in the wire between the transmission range switch and ground (G101), or repair poor ground (G101), then go to step 27.

18. Measure the voltage between transmission range switch connector terminals No. 6 and No. 9.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 86: Measuring Voltage Between Transmission Range Switch Connector Terminal No. 6 And No 9.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Go to step 19.

NO - Repair open in the wire between the transmission range switch and PCM connector terminal C17, then go to step 27.

19. Measure the voltage between transmission range switch connector terminals No. 4 and No. 6.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 87: Measuring Voltage Between Transmission Range Switch Connector Terminal No. 4 And No 6.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Go to step 20.

NO - Repair open in the wire between the transmission range switch and PCM connector terminal C17, then go to step 27.

20. Reconnect all connectors.
21. Update the A/T software in the PCM if it does not have the latest software, or substitute a known-good PCM.
22. Turn the ignition switch to LOCK (0).
23. Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.
24. Start the engine, and turn the VSA off (the light on the VSA OFF switch comes on). Run the engine in D until the vehicle speed reaches 31 mph (50 km/h), then slow down and stop the wheels.
25. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0706 indicated?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

step 1.

NO - Go to step 23.

26. Monitor the OBD STATUS for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM. If any other DTCs were indicated on step 25, go to the indicated DTC's troubleshooting.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM, then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 22 and recheck.

27. Clear the DTC with the HDS..
28. Turn the ignition switch to LOCK (0).
29. Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.
30. Start the engine, and turn the VSA off (the light on the VSA OFF switch comes on). Run the engine in D until the vehicle speed reaches 30 mph (48 km/h), then slow down and stop the wheels.
31. Check for Temporary DTCs or DTCs with the HDS

Is DTC P0706 indicated?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1.

NO -Go to step 32.

32. Monitor the OBD STATUS for P0706 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 31, go to the indicated DTC's troubleshooting.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 28 and recheck.

DTC P0711: Problem in ATF Temperature Sensor Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL

TROUBLESHOOTING INFORMATION)

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Check the ATF temperature with the HDS in the A/T data list.

Does the ATF temperature exceed the ambient air temperature?

YES - Record the ATF temperature. Leave the engine off for at least 30 minutes, and go to step 2.

NO - Record the ATF temperature. Test the stall speed RPM (see **STALL SPEED TEST**) three times. Go to step 2 after stall speed testing.

2. Check the ATF temperature with the HDS.

Did the ATF temperature change?

YES - Leave the engine off for at least 30 minutes, and go to step 3.

NO - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 5.

3. Check the ECT Sensor with the HDS.

Is the ECT Sensor reading the same as the ambient air temperature?

YES - Go to step 4.

NO - Leave the engine off until the ECT Sensor reads the same as ambient air temperature, then go to step 4.

4. Check the ATF Temp Sensor with the HDS.

Does the ATF temperature read about the same as the ECT Sensor?

YES - Go to step 11.

NO - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 5.

5. Clear the DTC with the HDS.
6. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
7. Turn the ignition switch to LOCK (0), and allow the engine coolant temperature to cool to ambient air temperature.
8. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Let the

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

engine run for at least another 20 seconds, then drive the vehicle at speeds over 19 mph (31 km/h) for at least 5 minutes.

9. Check for DTCs with the HDS.

Is DTC P0711 indicated?

YES - Check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1.

NO - Go to step 10.

10. Monitor the OBD STATUS for P0711 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated in step 9, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the screen indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1. If the screen indicates NOT COMPLETED, go to step 5.

11. Update the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
12. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
13. Turn the ignition switch to LOCK (0), then allow the engine coolant temperature to cool to ambient air temperature.
14. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on). Let the engine run for at least another 20 seconds, then drive the vehicle at speeds over 19 mph (31 km/h) for at least 5 minutes.
15. Check for DTCs with the HDS.

Is DTC P0711 indicated?

YES - Check for intermittent short to body ground in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then go to step 12. If the PCM was substituted, go to step 1.

NO - Go to step 16.

16. Monitor the OBD STATUS for P0711 in the DTCs MENU with the HDS.

Does the screen indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated in step 15, go to the

INDICATED DTCS TROUBLESHOOTING.

NO - If the HDS indicates FAILED, check for intermittent short to body ground in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then go to step 12. If the PCM was substituted, go to step 1. If the screen indicates NOT COMPLETED, go to step 12.

DTC P0712: Short in ATF Temperature Sensor Circuit**NOTE:**

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Check the ATF temperature sensor voltage with the HDS in the A/T data list.

Is the ATF Temp Sensor voltage 0.07 V or less?

YES - Go to step 2.

NO - Intermittent failure, the system is OK at this time. Check for an intermittent short in the ATFT wire between the ATF temperature sensor and the PCM.

2. Disconnect the ATF temperature sensor connector at the transmission end cover.
3. Check the ATF Temp Sensor voltage with the HDS.

Is the ATF Temp Sensor voltage 0.07 V or less?

YES - Go to step 4.

NO - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 13.

4. Turn the ignition switch to LOCK (0).
5. Jump the SCS line with the HDS.
6. Disconnect PCM connector C (49P).
7. Check for continuity between ATF temperature sensor connector terminal No. 2 and body ground.

ATF TEMPERATURE SENSOR CONNECTOR

Wire side of female terminals

Fig. 88: Identifying Continuity Between ATF Temperature Sensor Connector Terminal No 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C33 and ATF temperature sensor connector terminal No. 2, then go to step 13.

NO - Go to step 8.

8. Reconnect all connectors.
9. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
10. Start the engine in P, and let it run for at least 20 seconds.
11. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0712 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 12.

12. Monitor the OBD STATUS for P0712 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 11, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 10 and recheck.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

13. Clear the DTC with the HDS.
14. Start the engine in P, and let it run for at least 20 seconds.
15. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0712 indicated ?

YES - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to step 1.

NO - Go to step 16.

16. Monitor the OBD STATUS for P0712 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 15, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, go to step 1. If the HDS indicates NOT COMPLETED, return to step 14 and recheck.

DTC P0713: Open in ATF Temperature Sensor Circuit

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Check the ATF Temp Sensor voltage with the HDS in the A/T data list.

Does the ATF Temp Sensor voltage exceed 4.93 V?

YES - Go to step 2.

NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ATF temperature sensor and the PCM.

2. Turn the ignition switch to LOCK (0).
3. Disconnect the ATF temperature sensor connector at the transmission end cover.
4. Turn the ignition switch to ON (II).
5. Measure the voltage between ATF temperature sensor connector terminal No. 2 and body ground.

ATF TEMPERATURE SENSOR CONNECTOR

Wire side of female terminals

Fig. 89: Identifying Voltage Between ATF Temperature Sensor Connector Terminal No 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 6.

NO - Go to step 7.

6. Measure the voltage between ATF temperature sensor connector terminals No. 1 and No. 2.

ATF TEMPERATURE SENSOR CONNECTOR

Wire side of female terminals

Fig. 90: Identifying Voltage Between ATF Temperature Sensor Connector Terminals No 1 And No 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 16.

NO - Repair open in the wire between PCM connector terminal C16 and the ATF temperature sensor connector, then go to step 16.

7. Turn the ignition switch to LOCK (0).

8. Jump the SCS line with the HDS.

9. Disconnect PCM connector C (49P).
10. Check for continuity between PCM connector terminal C33 and ATF temperature sensor connector terminal No. 2.

Fig. 91: Identifying Continuity Between PCM Connector Terminal C33 And ATF Temperature Sensor Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM. If the connections are OK, go to step 11.

NO - Repair open in the wire between PCM connector terminal C33 and the ATF temperature sensor, then go to step 16.

11. Connect all connectors.
12. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
13. Start the engine in P, and let it run for at least 20 seconds.
14. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0713 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 15.

15. Monitor the OBD STATUS for P0713 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 14, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 12 and recheck.

16. Connect the ATF temperature sensor connector.
17. Clear the DTC with the HDS.
18. Start the engine in P, and let it run for at least 20 seconds.
19. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0713 indicated ?

YES - Check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to step 1.

NO - Go to step 20.

20. Monitor the OBD STATUS for P0713 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 19, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 18 and recheck.

DTC P0716: Problem in Input Shaft (Mainshaft) Speed Sensor Circuit; DTC P0717: Problem in Input Shaft (Mainshaft) Speed Sensor Circuit (No Signal Input)

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.
3. Check for proper input shaft (mainshaft) speed sensor installation (see **INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT**). If the sensor was installed improperly, correct the problem, then go to step 36.

4. Start the engine, and turn the VSA off (the light on the VSA OFF switch comes on). Run the engine in D, and hold the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds. Slow down and stop the wheel.
5. Monitor the OBD STATUS for P0716 or P0717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for loose or poor connections at the PCM and input shaft (mainshaft) speed sensor connectors. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors B (49P) and C (49P).
9. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 92: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 37.

10. Connect PCM connectors B (49P) and C (49P).
11. Disconnect the input shaft (mainshaft) speed sensor connector.
12. Turn the ignition switch to ON (II).

13. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

**INPUT SHAFT (MAINSHAFT)
SPEED SENSOR CONNECTOR**

Wire side of female terminals

Fig. 93: Identifying Voltage Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal 1 And Body Ground

Is there about 5 V?

YES - Go to step 17.

NO - Go to step 14.

14. Turn the ignition switch to LOCK (0).
15. Disconnect PCM connector C (49P).
16. Check for continuity between PCM connector terminal C12 and input shaft (mainshaft) speed sensor connector terminal No. 1.

Fig. 94: Identifying Continuity Between PCM Terminal C12 And Input Shaft (Mainshaft) Speed Sensor Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between PCM connector terminal C12 and the input shaft (mainshaft) speed sensor, then go to step 37.

17. Turn the ignition switch to LOCK (0).
18. Disconnect PCM connector B (49P).
19. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

**INPUT SHAFT (MAINSHAFT)
SPEED SENSOR CONNECTOR**

Wire side of female terminals

Fig. 95: Identifying Continuity Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal B37 and the input shaft (mainshaft) speed sensor connector, then go to step 37.

NO - Go to step 20.

20. Disconnect PCM connector C (49P).
21. Check for continuity between PCM connector terminal C16 and input shaft (mainshaft) speed sensor connector terminal No. 3.

Fig. 96: Identifying Continuity Between PCM Terminal C16 And Input Shaft (Mainshaft) Speed Sensor Terminal 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the input shaft (mainshaft) speed sensor connector and PCM connector terminal C16, then go to step 37.

22. Connect PCM connectors B (49P) and C (49P).
23. Turn the ignition switch to ON (II).
24. Measure the voltage between input shaft (mainshaft) speed sensor connector terminals No. 2 and No. 3.

Wire side of female terminals

Fig. 97: Identifying Voltage Between Input Shaft (Mainshaft) Speed Sensor Connector Terminals No 2 And 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 28.

NO - Go to step 25.

25. Turn the ignition switch to LOCK (0).
26. Disconnect PCM connector B (49P).
27. Check for continuity between PCM connector terminal B37 and input shaft (mainshaft) speed sensor connector terminal No. 2.

Fig. 98: Identifying Continuity Between PCM Terminal B37 And Input Shaft (Mainshaft) Speed Sensor Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between PCM connector terminal B37 and the input shaft (mainshaft) speed sensor, then go to step 37.

28. Connect the input shaft (mainshaft) speed sensor connector.
29. Clear the DTC with the HDS.
30. Start the engine, run the vehicle in D, and hold the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds.
31. Monitor the OBD STATUS for P0716 or P717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Replace the input shaft (mainshaft) speed sensor (see **INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 37.

NO - Go to step 32.

32. Reconnect all connectors.
33. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

34. Start the engine, run the vehicle in D. Hold the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds.
35. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0716 or P0717 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 36.

36. Monitor the OBD STATUS for P0716 or P717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 35, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 34 and recheck.

37. Clear the DTC with the HDS.
38. Start the engine, run the vehicle in D. Hold the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds while no shifting is taking place.
39. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0716 or P0717 indicated?

YES - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to step 1.

NO - Go to step 40.

40. Monitor the OBD STATUS for P0716 or P0717 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 39, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the input shaft

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

(mainshaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 38 and recheck.

DTC P0718: Input Shaft (Mainshaft) Speed Sensor Intermittent Failure

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle at speeds over 12 mph (20 km/h) in D through all five gears.
3. Monitor the OBD STATUS for P0718 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 4.

NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the input shaft (mainshaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, return to step 2 and recheck.

4. Turn the ignition switch to LOCK (0)
5. Disconnect the input shaft (mainshaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

Are the connector terminals OK?

YES - Go to step 6.

NO - Repair the connector terminals, then go to step 6.

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors B (49P) and C (49P).
9. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 99: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then 27 .

10. Connect PCM connectors B (49P) and C (49P).
11. Disconnect the input shaft (mainshaft) speed sensor connector.
12. Turn the ignition switch to ON (II).
13. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 23.

**INPUT SHAFT (MAINSHAFT)
 SPEED SENSOR CONNECTOR**

Fig. 100: Identifying Voltage Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Turn the ignition switch to LOCK (0).
15. Disconnect PCM connector B (49P).
16. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

**INPUT SHAFT (MAINSHAFT)
SPEED SENSOR CONNECTOR**

Wire side of female terminals

Fig. 101: Identifying Continuity Between Input Shaft (Mainshaft) Speed Sensor Connector Terminal 2 And Body Ground

Is there about 5 V?

YES - Replace the input shaft (mainshaft) speed sensor (see INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT), then go to step 31.

NO - Go to step 20.

20. Turn the ignition switch to LOCK (0).
21. Disconnect PCM connector B (49P).
22. Check for continuity between PCM connector terminal B37 and input shaft (mainshaft) speed sensor connector terminal No. 2.

Fig. 103: Identifying Continuity Between PCM Terminal B37 And Input Shaft (Mainshaft) Speed Sensor Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between PCM connector terminal B37 and the input shaft (mainshaft) speed sensor, then go to step 31.

23. Turn the ignition switch to LOCK (0).
24. Disconnect PCM connector C (49P).
25. Check for continuity between PCM connector terminal C12 and input shaft (mainshaft) speed sensor connector terminal No. 1.

Fig. 104: Identifying Continuity Between PCM Terminal C12 And Input Shaft (Mainshaft) Speed Sensor Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between PCM connector terminal C12 and the input shaft (mainshaft) speed sensor, then go to step 31.

26. Reconnect all connectors.
27. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE** , or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
28. Test-drive the vehicle at speeds over 12 mph (20 km/h) in D through all five gears.
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0718 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 30.

30. Monitor the OBD STATUS for P0718 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM(see **PCM REPLACEMENT** . If any other DTCs were indicated on step 28, go to the indicated DTC's troubleshooting.

NO -If the HDS indicates FAILED, check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM, then

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 28 and recheck.

31. Clear the DTC with the HDS.
32. Test-drive the vehicle at speeds over 12 mph (20 km/h) in D through all five gears.
33. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0718 indicated?

YES - Check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to step 1.

NO - Go to step 34.

34. Monitor the OBD STATUS for P0718 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 33, go to the indicated DTC's troubleshooting.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the input shaft (mainshaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 32 and recheck.

DTC P0721: Problem in Output Shaft (Countershaft) Speed Sensor Circuit; DTC P0722: Problem in Output Shaft (Countershaft) Speed Sensor Circuit (No Signal Input)

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.
3. Check for proper output shaft (countershaft) speed sensor installation (see OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT). If the sensor is installed improperly, correct problem, then go to step 37.
4. Start the engine. Run the vehicle in D with the engine speed at 2,000 rpm or higher, for at least 10 seconds.
5. Monitor the OBD STATUS for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for loose or poor connections at the PCM and output shaft (countershaft) speed sensor connectors. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors B (49P) and C (49P).
9. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 105: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 37.

10. Connect PCM connectors B (49P) and C (49P).
11. Disconnect the output shaft (countershaft) speed sensor connector.
12. Turn the ignition switch to ON (II).
13. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.

Is there continuity?

YES - Go to step 22.

NO - Repair open in the wire between the output shaft (countershaft) speed sensor connector and PCM connector terminal C15, then go to step 37.

22. Connect PCM connectors B (49P) and C (49P).
23. Turn the ignition switch to ON (II).
24. Measure the voltage between output shaft (countershaft) speed sensor connector terminals No. 2 and No. 3.

**OUTPUT SHAFT (COUNTERSHAFT)
SPEED SENSOR CONNECTOR**

Wire side of female terminals

Fig. 110: Identifying Voltage Between Output Shaft (Countershaft) Speed Sensor Connector Terminals No 2 And 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 28.

NO - Go to step 25.

25. Turn the ignition switch to LOCK (0).
26. Disconnect PCM connector B (49P).
27. Check for continuity between PCM connector terminal B38 and output shaft (countershaft) speed sensor connector terminal No. 2.

Fig. 111: Identifying Continuity Between PCM Terminal B38 And Output Shaft (Countershaft) Speed Sensor Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 32.

NO - Repair open in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor, then go to step 37.

28. Connect the output shaft (countershaft) speed sensor connector.
29. Clear the DTC with the HDS.
30. Start the engine. Run the vehicle in D with the engine speed at 2,000 rpm or higher, for at least 10 seconds.
31. Monitor the OBD STATUS for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Replace the output shaft (countershaft) speed sensor (see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 37.

NO - Go to step 32.

32. Reconnect all connectors.
33. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
34. Start the engine, run the vehicle in D, and hold the vehicle at speeds over 12 mph (20 km/h) for at least 10 seconds when the transmission is not shifting.
35. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0721 or P0722 indicated?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 36.

36. Monitor the OBD STATUS for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 35, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 34 and recheck.

37. Clear the DTC with the HDS.
38. Start the engine. Run the vehicle in D with the engine speed at 2,000 rpm or higher, for at least 10 seconds.
39. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0721 or P0722 indicated?

YES - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to step 1.

NO - Go to step 40.

40. Monitor the OBD STATUS for P0721 or P0722 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 39, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 38 and recheck.

DTC P0723: Output Shaft (Countershaft) Speed Sensor Intermittent Failure

NOTE:

- Before you troubleshoot, record all freeze data and any on-board

snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Clear the DTC with the HDS.
2. Start the engine, run the vehicle in D through all five gears with engine speed at 2,000 rpm or higher, slow down and stop the wheels.
3. Monitor the OBD STATUS for P0723 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 4.

NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM. If the HDS indicates NOT COMPLETED, return to step 2 and recheck.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the output shaft (countershaft) speed sensor connector, and inspect the connector and connector terminals to be sure they are making good contact.

Are the connector terminals OK?

YES - Go to step 6.

NO - Repair the connector terminals, then go to step 6.

6. Turn the ignition switch to LOCK (0).
7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors B (49P) and C (49P).
9. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Is there continuity?

Fig. 112: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

YES -Go to step 10.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 31.

10. Connect PCM connectors B (49P) and C (49P).
11. Disconnect the output shaft (countershaft) speed sensor connector
12. Turn the ignition switch to ON (II).
13. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.

**OUTPUT SHAFT (COUNTERSHAFT)
SPEED SENSOR CONNECTOR**

Fig. 113: Identifying Voltage Between Output Shaft (Countershaft) Speed Sensor Connector Terminal 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 14.

NO - Go to step 23.

14. Turn the ignition switch to LOCK (0).
15. Disconnect PCM connector B (49P).
16. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

**OUTPUT SHAFT (COUNTERSHAFT)
SPEED SENSOR CONNECTOR**

Wire side of female terminals

Fig. 114: Identifying Continuity Between Output Shaft (Countershaft) Speed Sensor Connector Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor connector, then go to step 3131.

NO - Go to step 17.

17. Connect PCM connector B (49P).
18. Turn the ignition switch to ON (II).
19. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

**OUTPUT SHAFT (COUNTERSHAFT)
SPEED SENSOR CONNECTOR**

Wire side of female terminals

Fig. 115: Identifying Voltage Between Output Shaft (Countershaft) Speed Sensor Connector Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the output shaft (countershaft) speed sensor(see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**, then go to step 31 .

NO - Go to step 20.

20. Turn the ignition switch to LOCK (0).
21. Disconnect PCM connector B (49P).
22. Check for continuity between PCM connector terminal B38 and output shaft (countershaft) speed sensor connector terminal No. 2.

Fig. 116: Identifying Continuity Between PCM Terminal B38 And Output Shaft (Countershaft) Speed Sensor Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor, then go to step 3131.

23. Turn the ignition switch to LOCK (0).
24. Disconnect PCM connector B (49P).
25. Check for continuity between PCM connector terminal B36 and output shaft (countershaft) speed sensor connector terminal No. 1.

Fig. 117: Identifying Continuity Between PCM Terminal B36 And Output Shaft (Countershaft) Speed Sensor Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 26.

NO - Repair open in the wire between PCM connector terminal 636 and the output shaft (countershaft) speed sensor, then go to step 31.31

26. Reconnect all connectors.
27. Update the A/T software in the PCM if it does not have the latest software (see **PCM Update**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
28. Start the engine, run the vehicle in D through all five gears with engine speed at 2,000 rpm or higher, slow down and stop the wheels.
29. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0723 indicated?

YES - If the PCM was updated, substitute a known-good PCM **SUBSTITUTE THE PCM**, then recheck. If the PCM was substituted, go to step 11.

NO - Go to step 30.

30. Monitor the OBD STATUS for P0723 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 29, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the output shaft

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

(countershaft) speed sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 28 and recheck.

31. Clear the DTC with the HDS.
32. Start the engine, run the vehicle in D through all five gears with engine speed at 2,000 rpm or higher, slow down and stop the wheels.
33. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0723 indicated?

YES - Check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to step 11

NO -Go to step 34.

34. Monitor the OBD STATUS for P0723 in the DTCs/Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 3333, go to the indicated DTC's troubleshooting.

NO -If the HDS indicates FAILED, check for poor connections and loose terminals at the output shaft (countershaft) speed sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 32 and recheck.

DTC P0731: Problem in 1st Clutch and 1st Clutch Hydraulic Circuit

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 9.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is the line pressure within the service limits?

YES - Go to step 5.

NO - Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 9.

5. Measure the 1st clutch pressure (see **PRESSURE TEST**).

Is the 1st clutch pressure within the service limits?

YES - Go to step 6.

NO - Shift valves B and C are stuck. Repair these valves and hydraulic circuit, or replace the transmission, then go to step 9.

6. Clear the DTC with the HDS.
7. Test-drive the vehicle: Start off in D, accelerate at 10 % opened-throttle or more, and run the vehicle in 1st gear at speeds over 7 mph (12 km/h) with the engine speed at 1,000 rpm or higher, for at least 12 seconds. Slow down and stop the wheels.
8. Monitor the OBD STATUS for P0731 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair the 1st clutch, or replace the transmission, then go to step 19.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 7 and recheck.

9. Test-drive the vehicle: Start off in D, accelerate at 10 % opened-throttle or more, and run the vehicle in 1st gear at speeds over 7 mph (12 km/h) with the engine speed at 1,000 rpm or higher, for at least 12 seconds. Slowdown and stop the wheels.
10. Monitor the OBD STATUS for P0731 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

DTC P0732: Problem in 2nd Clutch and 2nd Clutch Hydraulic Circuit

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 9.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

Is the line pressure within the service limits?

YES - Go to step 5.

NO - Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 9.

5. Measure the 2nd clutch pressure (see **PRESSURE TEST**).

Is the 2nd clutch pressure within the service limits?

YES - Go to step 6.

NO - Shift valves A, B, and C are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 9.

6. Clear the DTC with the HDS.
7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 2nd gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slow down and stop the wheels.
8. Monitor the OBD STATUS for P0732 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair the 2nd clutch, or replace the transmission, then go to step 9.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 7 and recheck.

9. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 2nd gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slowdown and stop the wheels.
10. Monitor the OBD STATUS for P0732 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

DTC P0733: Problem in 3rd Clutch and 3rd Clutch Hydraulic Circuit

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 9.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Measure the line pressure (see PRESSURE TEST).

Is the line pressure within the service limits?

YES - Go to step 5.

NO - Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 9.

5. Measure the 3rd clutch pressure (see PRESSURE TEST).

Is the 3rd clutch pressure within the service limits?

YES - Go to step 6.

NO - Shift valves A, B, and C are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 9.

6. Clear the DTC with the HDS.
7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 3rd gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slow down and stop the wheels.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

8. Monitor the OBD STATUS for P0733 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair the 3rd clutch, or replace the transmission, then go to step 9.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 7 and recheck.

9. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 3rd gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slow down and stop the wheels.
10. Monitor the OBD STATUS for P0733 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

DTC P0734: Problem in 4th Clutch and 4th Clutch Hydraulic Circuit

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 9.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Measure the line pressure (see PRESSURE TEST).

Is the line pressure within the service limits?

YES - Go to step 5.

NO - Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 9.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

5. Measure the 4th clutch pressure (see **PRESSURE TEST**).

Is the 4th clutch pressure within the service limits?

YES - Go to step 6.

NO - Shift valves A, B, C, and D are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 9.

6. Clear the DTC with the HDS.
7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 4th gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slow down and stop the wheels.
8. Monitor the OBD STATUS for P0734 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair the 4th clutch, or replace the transmission, then go to step 9.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 7 and recheck.

9. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 4th gear in D at speeds over 7 mph (12 km/h) for 12 seconds. Slow down and stop the wheels.
10. Monitor the OBD STATUS for P0734 in the DTCs/ Freeze Data in A/T Mode Menu for at least a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

DTC P0735: Problem in 5th Clutch and 5th Clutch Hydraulic Circuit

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 9.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Measure the line pressure (see **PRESSURE TEST**).

Is the line pressure within the service limits?

YES - Go to step 5.

NO - Repair the ATF pump and the regulator valve, or replace the transmission, then go to step 9.

5. Measure the 5th clutch pressure (see **PRESSURE TEST**).

Is the 5th clutch pressure within the service limits?

YES - Go to step 6.

NO - Shift valves A, B, C, and D are stuck. Repair these valves and the hydraulic circuit, or replace the transmission, then go to step 9.

6. Clear the DTC with the HDS.
7. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 5th gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slow down and stop the wheels.
8. Monitor the OBD STATUS for P0735 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair the 5th clutch, or replace the transmission, then go to step 9.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 7 and recheck.

9. Test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, or drive in 5th gear in D at speeds over 7 mph (12 km/h) for at least 12 seconds. Slow down and stop the wheels.
10. Monitor the OBD STATUS for P0735 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT

COMPLETED, return to step 9 and recheck.

DTC P0741: Torque Converter Clutch Hydraulic Circuit Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 12.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Select Shift Solenoid E in the Miscellaneous Test Menu, and check that shift solenoid valve D operates with the HDS.

Is a clicking sound heard?

YES - Go to step 6.

NO - Replace shift solenoid valve D (see SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT), then go to step 12.

6. Run the engine until the engine coolant temperature reaches 176 °F (80 °C).
7. Select Clutch Pressure Control (Linear) Solenoid C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

Does the result indicate NORMAL?

YES - Go to step 8.

NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to 10 step . If any part is replaced, go to step 11.

8. Test-drive the vehicle on a level road with a steady throttle at 60 mph (96 km/h) for at least 22 seconds.
9. Monitor the OBD STATUS for P0741 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Repair the faulty torque converter clutch mechanism, torque converter clutch hydraulic circuit, lock-up shift valve, lock-up control valve, or replace the transmission/then go to step 12.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

10. Inspect A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C TEST**).

Does A/T clutch pressure control solenoid valve C work properly?

YES - Repair the hydraulic system related to the lock-up shift valve, lock-up control valve, and lock-up timing valve, or replace the transmission, then go to step 12.

NO - Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C REPLACEMENT**), then go to step 12.

11. Clear the DTC with the HDS.
12. Test-drive the vehicle on a level road with a steady throttle at 60 mph (96 km/h) for at least 22 seconds, or test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data.
13. Monitor the OBD STATUS for P0741 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 12 and recheck.

DTC P0746: A/T Clutch Pressure Control Solenoid Valve A Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in Q, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P0746 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

Does the HDS indicate NORMAL?

YES - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to step 9. If any part is replaced, go to step 10.

9. Inspect A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A TEST**).

Does A/T clutch pressure control solenoid valve A work properly?

YES - Repair the hydraulic system related with shift valve A, or replace the transmission, then go to step 11.

NO - Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**), then go to step 11.

10. Clear the DTC with the HDS.
11. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
12. Monitor the OBD STATUS for P0746 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT

COMPLETED, return to step 11 and recheck.

DTC P0747: A/T Clutch Pressure Control Solenoid Valve A Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P0747 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

Does the HDS indicate NORMAL?

YES - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to step 10. If any part is replaced, go to step 10.

9. Inspect A/T clutch pressure control solenoid valve A (see A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A TEST).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does A/T clutch pressure control solenoid valve A work properly?

YES - Repair the hydraulic system related with shift valve A, or replace the transmission, then go to step 11.

NO - Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**), then go to step 11.

10. Clear the DTC with the HDS.
11. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
12. Monitor the OBD STATUS for P0747 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0751: Shift Solenoid Valve A Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P0751 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid A in the Miscellaneous Test Menu, and check that shift solenoid valve A operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve A (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 1111.

9. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
10. Monitor the OBD STATUS for P0751 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve A, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
12. Monitor the OBD STATUS for P0751 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0752: Shift Solenoid Valve A Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 11 seconds.
6. Monitor the OBD STATUS for P0752 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid A in the Miscellaneous Test Menu, and check that shift solenoid valve A operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve A (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 11.

9. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 11 seconds.
10. Monitor the OBD STATUS for P0752 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve A, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 11 seconds.
12. Monitor the OBD STATUS for P0752 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0756: Shift Solenoid Valve B Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D through all five gears, then slow down to a stop.
6. Monitor the OBD STATUS for P0756 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid B in the Miscellaneous Test Menu, and check that shift solenoid valve B operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve B (see SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT), then go to step 11

9. Test-drive the vehicle in D through all five gears, then slow down to a stop.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

10. Monitor the OBD STATUS for P0756 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve B, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle in D through all five gears, then slow down to a stop.
12. Monitor the OBD STATUS for P0756 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0757: Shift Solenoid Valve B Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 11 seconds.
6. Monitor the OBD STATUS for P0757 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid B in the Miscellaneous Test Menu, and check that shift solenoid valve B operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve B (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 1111

9. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 11 seconds.
10. Monitor the OBD STATUS for P0757 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Repair shift valve B, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 11 seconds.
12. Monitor the OBD STATUS for P0757 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0761: Shift Solenoid Valve C Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 20 seconds.
6. Monitor the OBD STATUS for P0761 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid C in the Miscellaneous Test Menu, and check that shift solenoid valve C operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 11.11

9. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 20 seconds.
10. Monitor the OBD STATUS for P0761 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve C, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 20 seconds.
12. Monitor the OBD STATUS for P0761 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0762: Shift Solenoid Valve C Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 20 seconds.
6. Monitor the OBD STATUS for P0762 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid C in the Miscellaneous Test Menu, and check that shift solenoid valve C operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve C (see SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT), then go to step 11.11

9. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 20 seconds.
10. Monitor the OBD STATUS for P0762 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve C, or replace the transmission, then go to step 11.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle in D, then run the vehicle in 5th gear for at least 20 seconds.
12. Monitor the OBD STATUS for P0762 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0766: Shift Solenoid Valve D Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears at least 11 seconds.
6. Monitor the OBD STATUS for P0766 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid D in the Miscellaneous Test Menu, and check that shift solenoid valve D operates with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 11.11

9. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears at least 11 seconds.
10. Monitor the OBD STATUS for P0766 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Repair shift valve D, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears at least 11 seconds.
12. Monitor the OBD STATUS for P0766 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0767: Shift Solenoid Valve D Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P0767 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Shift Solenoid D in the Miscellaneous Test Menu, and check that shift solenoid valve D operates with the HDS.

Is a clicking sound heard?

YES - Go to step 9.

NO - Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 11.11

9. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
10. Monitor the OBD STATUS for P0767 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve D, or replace the transmission, then go to step 11.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 9 and recheck.

11. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
12. Monitor the OBD STATUS for P0767 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0776: A/T Clutch Pressure Control Solenoid Valve B Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D, then continue in 5th gear for at least 20 seconds.
6. Monitor the OBD STATUS for P0776 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

Does the HDS indicate NORMAL? .

YES - If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

NO -Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to step 9. If any part is replaced, go to step 9. ,then go to step 1010.

9. Inspect A/T clutch pressure control solenoid valve B.**A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B TEST**

Does A/T clutch pressure control solenoid valve B work properly?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Repair the hydraulic system related with shift valve B, or replace the transmission, then go to step 11.

NO - Replace A/T clutch pressure control solenoid valve B, then go to step 11.

10. Clear the DTC with the HDS
11. Test-drive the vehicle in D, then continue in 5th gear for at least 20 seconds.
12. Monitor the OBD STATUS for P0776 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0777: A/T Clutch Pressure Control Solenoid Valve B Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 1111.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P0777 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

Does the HDS indicate NORMAL?

YES - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to step 9. If any part is replaced, go to step 10.

9. Inspect A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B TEST**).

Does A/T clutch pressure control solenoid valve B work properly?

YES - Repair the hydraulic system related with shift valve B, or replace the transmission, then go to step 11.

NO - Replace A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**), then go to step 11.

10. Clear the DTC with the HDS.
11. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
12. Monitor the OBD STATUS for P0777 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0796: A/T Clutch Pressure Control Solenoid Valve C Stuck OFF

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Start the engine, and shift into D while pressing the brake pedal, wait for at least 3 seconds. Test-drive the vehicle in R at speeds below 6 mph (9 km/h) for at least 3 seconds.
6. Monitor the OBD STATUS for P0796 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

Does the HDS indicate NORMAL?

YES - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined the cause of the failure, go to step 9. If any part is replaced, go to step 10.

9. Inspect A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C TEST**).

Does A/T clutch pressure control solenoid valve C work properly?

YES - Repair the hydraulic system related with shift valve C, or replace the transmission, then go to step 11.

NO - Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C REPLACEMENT**), then go to step 11.

10. Clear the DTC with the HDS.
11. Start the engine, and shift into D while pressing the brake pedal, wait for at least 3 seconds. Test-drive the vehicle in R at speeds below 6 mph (9 km/h) for at least 3 seconds.
12. Monitor the OBD STATUS for P0796 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0797: A/T Clutch Pressure Control Solenoid Valve C Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 11.

NO - Replace the ATF (see step 7 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D, then continue in 5th gear for at least 20 seconds.
6. Monitor the OBD STATUS for P0797 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Clear the DTC with the HDS.
8. Select Clutch Pressure Control (Linear) Solenoid C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

Does the HDS indicate NORMAL?

YES - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 8 and recheck.

NO - Follow the instructions indicated on the HDS by the test result, but if the HDS has not determined

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

the cause of the failure, go to step 9. If any part is replaced, go to step 10.

9. Inspect A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C TEST**).

Does A/T clutch pressure control solenoid valve C work properly?

YES - Repair the hydraulic system related with shift valve C, or replace the transmission, then go to step 11.

NO - Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C REPLACEMENT**), then go to step 11.

10. Clear the DTC with the HDS.
11. Test-drive the vehicle in D, then continue in 5th gear for at least 20 seconds.
12. Monitor the OBD STATUS for P0797 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - If the HDS indicates FAILED, return to step 1 and recheck. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

DTC P0812: Open in Transmission Range Switch ATP R Switch Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Shift to R, and check the A/T R Switch signal with the HDS in the A/T data list.

Is the A/T R Switch ON?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 3.

3. Turn the ignition switch to LOCK (0).
4. Disconnect the transmission range switch connector.
5. Check for continuity between transmission range switch connector terminal No. 6 and body ground.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 118: Identifying Continuity Between Transmission Range Switch Connector Terminal 6 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 6.

NO - Repair open in the wire between transmission range switch connector terminal No. 5 and ground (G101), or repair poor ground (G101), then go to step 14.

6. Turn the ignition switch to ON (II).
7. Measure the voltage between transmission range switch connector terminals No. 6 and No. 8.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 119: Identifying Voltage Between Transmission Range Switch Connector Terminals No 6 And No 8

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Go to step 8.

NO - Repair open in the wire between PCM connector terminal C25 and the transmission range switch, then go to step 14.

8. Check for continuity between transmission range switch connector terminals No. 6 and No. 8 while the shift lever is in each position.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 120: Identifying Continuity Between Transmission Range Switch Connector Terminals No 6 And No 8

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity while the shift lever is in P, R, and N, and no continuity while the shift lever is in the D and D3?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the connections are OK, go to step 9.

NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 9.

9. Reconnect the transmission range switch connector.
10. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
11. Test-drive the vehicle in R at speeds below 3 mph (5 km/h) for at least 2 seconds. Then test-drive at speeds over 3 mph (5 km/h) for at least 2 seconds. Slow down and stop the wheels.
12. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0812 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Go to step 13.

13. Monitor the OBD STATUS for P0812 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS Indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 12, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 11 and recheck.

14. Clear the DTC with the HDS.
15. Test-drive the vehicle in R at speeds below 3 mph (5 km/h) for at least 2 seconds. Then test-drive at speeds over 3 mph (5 km/h) for at least 2 seconds. Slow down and stop the wheels.
16. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0812 indicated?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1.

NO - Go to step 17.

17. Monitor the OBD STATUS for P0812 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 16, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 15 and recheck.

DTC P0815: Short in Transmission Gear Selection Switch Upshift Switch Circuit, or Transmission Gear Selection Switch Upshift Switch Stuck ON

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Shift to P.
3. Check the Upshift Switch signal input with the HDS in the A/T data list.

Is the Upshift Switch ON?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check the S-UP (BLU) wire for an intermittent short to ground between the transmission gear selection switch and the PCM.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission gear selection switch/ park pin switch/A/T gear position indicator panel light connector at the shift lever bracket.
6. Turn the ignition switch to ON (II).
7. Check the transmission gear selection switch upshift switch signal input with the HDS in the A/T data list.

Is the Upshift Switch ON?

YES - Go to step 8.

NO - Replace the transmission gear selection switch (see **TRANSMISSION GEAR SELECTION SWITCH TEST**), then go to step 19.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector A (49P).
11. Check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminal No. 7 and body ground.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION
INDICATOR PANEL LIGHT CONNECTOR**

Wire side of female terminals

Fig. 121: Identifying Continuity Between Transmission Gear Selection Switch Connector Terminal 7 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is there continuity?

YES - Repair short in the wire between PCM connector terminal A36 and the transmission gear selection switch, then go to step 19.

NO - Go to step 12.

12. Reconnect all connectors.
13. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
14. Start the engine in P, wait at least 10 seconds, then shift to M.
15. Push the shift lever toward the upshift position (+) slowly, and release it; repeat this test 10 times or more.
16. Pull the shift lever toward the downshift position (-) slowly, and release it; repeat this test 10 times or more.
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0815 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for P0815 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 14 and recheck.

19. Clear the DTC with the HDS.
20. Start the engine in P, wait at least 10 seconds, then shift to M.
21. Push the shift lever toward the upshift position (+) slowly, and release it; repeat this test 10 times or more.
22. Pull the shift lever toward the downshift position (-) slowly, and release it; repeat this test 10 times or more.
23. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0815 indicated?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for P0815 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 23, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0816: Short in Transmission Gear Selection Switch Downshift Switch Circuit, or Transmission Gear Selection Switch Downshift Switch Stuck ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Shift to P.
3. Check the Downshift Switch signal input with the HDS in the A/T data list.

Is the Downshift Switch ON?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check the S-DN (GRN) wire for an intermittent short to ground between the transmission gear selection switch and the PCM.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission gear selection switch/ park pin switch/A/T gear position indicator panel light connector at the shift lever bracket.
6. Turn the ignition switch to ON (II).
7. Check the transmission gear selection switch downshift switch signal input with the HDS in the A/T data list.

Is the Downshift Switch ON?

YES - Go to step 8.

NO - Replace the transmission gear selection switch (see **TRANSMISSION GEAR SELECTION SWITCH TEST**), then go to step 19.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector A (49P).
11. Check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminal No. 8 and body ground.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION
INDICATOR PANEL LIGHT CONNECTOR**

Wire side of female terminals

Fig. 122: Identifying Continuity Between Transmission Gear Selection Switch Connector Terminal 8 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to ground in the wire between PCM connector terminal A37 and the transmission gear selection switch, then go to step 19.

NO - Go to step 12.

12. Reconnect all connectors.
13. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
14. Start the engine in P, wait at least 10 seconds, then shift to M.
15. Push the shift lever toward the upshift position (+) slowly, and release it; repeat this test 10 times or more.
16. Pull the shift lever toward the downshift position (-) slowly, and release it; repeat this test 10 times or more.
17. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0816 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE**

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

PCM), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for P0816 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 14 and recheck.

19. Clear the DTC with the HDS.
20. Start the engine in P, wait at least 10 seconds, then shift to M.
21. Push the shift lever toward the upshift position (+) slowly, and release it; repeat this test 10 times or more.
22. Pull the shift lever toward the downshift position (-) slowly, and release it; repeat this test 10 times or more.
23. Check for Temporary DTCs or DTCs with the HDS. .

Is DTC P0816 indicated?

YES - Check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1.

NO - Go to step 24.

24. Monitor the OBD STATUS for P0816 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 23, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0842: Short in 2nd Clutch Transmission Fluid Pressure Switch Circuit, or 2nd Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Clear the DTC with the HDS.
2. Check the 2nd PRESSURE SWITCH signal with the HDS in the A/T data list when not in 2nd gear.

Is the 2nd Pressure Switch OFF?

YES - Go to step 3.

NO - Go to step 6.

3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Drive the vehicle in 3rd gear in M for at least 2 seconds.
5. Monitor the OBD STATUS for P0842 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the OP2SW wire for an intermittent short to ground between the 2nd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

6. Turn the ignition switch to LOCK (0).
7. Disconnect the 2nd clutch transmission fluid pressure switch connector.
8. Turn the ignition switch to ON (II).
9. Check the 2nd Pressure Switch signal with the HDS in the A/T data list.

Is the 2nd Pressure Switch OFF?

YES - Replace the 2nd clutch transmission fluid pressure switch (see 2nd Clutch Transmission Fluid Pressure Switch Replacement), then go to step 19.

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector C (49P).
13. Check for continuity between PCM connector terminal C27 and body ground.

PCM CONNECTOR C (49P)

Terminal side of female terminals

Fig. 123: Identifying Continuity Between PCM Connector Terminal C27 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C27 and the 2nd clutch transmission fluid pressure switch, then go to step 19.

NO - Go to step 14.

14. Reconnect all connectors.
15. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
16. Drive the vehicle in 2nd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds.
17. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0842 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for P0842 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

(see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 16 and recheck.

19. Clear the DTC with the HDS.
20. Drive the vehicle in 2nd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds.
21. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0842 indicated?

YES - Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO - Go to step 22.

22. Monitor the OBD STATUS for P0842 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 21, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0843: Open in 2nd Clutch Transmission Fluid Pressure Switch Circuit, or 2nd Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
3. Shift the shift lever into M while pressing the brake pedal, upshift to 2nd gear by pushing the shift lever to upshift position, and check with the HDS in the A/T data list that the SHIFT COMMAND indicates 2nd.
4. Check the 2nd Pressure Switch signal with the HDS in the A/T data list.

Is the 2nd Pressure Switch ON?

YES - Go to step 5.

NO - Go to step 7.

5. Drive the vehicle in 2nd gear in M for at least 2 seconds.
6. Monitor the OBD STATUS for P0843 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect the 2nd clutch transmission fluid pressure switch connector.
9. Turn the ignition switch to ON (II).
10. Measure the voltage between the 2nd clutch transmission fluid pressure switch connector terminal and body ground.

**2ND CLUTCH TRANSMISSION FLUID
PRESSURE SWITCH CONNECTOR**

Wire side of female terminals

Fig. 124: Identifying Voltage Between 2nd Clutch Transmission Fluid Pressure Switch Connector Terminal And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the 2nd clutch transmission fluid pressure switch (see **2nd Clutch Transmission Fluid Pressure Switch Replacement**), then go to step 20.

NO - Go to step 11.

11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C27 and the 2nd clutch transmission fluid pressure switch connector terminal.

Fig. 125: Identifying Continuity Between PCM Terminal C27 And 2nd Clutch Transmission Fluid Pressure Switch Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM. If the connections are OK, go to step 15.

NO - Repair open in the wire between PCM connector terminal C27 and the 2nd clutch transmission fluid pressure switch, then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Drive the vehicle in 2nd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0843 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0843 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTCS TROUBLESHOOTING**.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Drive the vehicle in 2nd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0843 indicated?

YES - Check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0843 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 2nd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P0847: Short in 3rd Clutch Transmission Fluid Pressure Switch Circuit, or 3rd Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Check the 3rd Pressure Switch signal with the HDS in the A/T data list when not in 3rd gear.

Is the 3rd Pressure Switch OFF ?

YES - Go to step 3.

NO - Go to step 6.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Drive the vehicle in 3rd gear in M for at least 2 seconds.
5. Monitor the OBD STATUS for P0847 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the OP3SW wire for an intermittent short to ground between the 3rd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

6. Turn the ignition switch to LOCK (0).
7. Disconnect the 3rd clutch transmission fluid pressure switch connector.
8. Turn the ignition switch to ON (II).
9. Check the 3rd Pressure Switch signal with the HDS in the A/T data list.

Is the 3rd Pressure Switch OFF?

YES - Replace the 3rd clutch transmission fluid pressure switch (see **3rd Clutch Transmission Fluid Pressure Switch Replacement**), then go to step 19.

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector C (49P).
13. Check for continuity between PCM connector terminal C38 and body ground.

PCM CONNECTOR C (49P)

Terminal side of female terminals

Fig. 126: Identifying Continuity Between PCM Connector Terminal C38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Repair short in the wire between PCM connector terminal C38 and the 3rd clutch transmission fluid pressure switch, then go to step 19.

NO - Go to step 14.

14. Reconnect all connectors.
15. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
16. Drive the vehicle in 3rd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds. Slow down and stop the wheels.
17. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0847 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for P0847 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 16 and recheck.

19. Clear the DTC with the HDS.
20. Drive the vehicle in 3rd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds. Slow down and stop the wheels.
21. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0847 indicated?

YES - Check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO - Go to step 22.

22. Monitor the OBD STATUS for P0847 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 21, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0848: Open in 3rd Clutch Transmission Fluid Pressure Switch Circuit, or 3rd Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
3. Drive the vehicle in 3rd gear in M, and check with the HDS in the A/T data list that the SHIFT COMMAND indicates 3rd.
4. Check the 3rd Pressure Switch signal with the HDS in the A/T data list.

Is the 3rd Pressure Switch ON?

YES - Go to step 5.

NO - Go to step 7.

5. Drive the vehicle in 3rd gear in M for at least 2 seconds.
6. Monitor the OBD STATUS for P0848 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect the 3rd clutch transmission fluid pressure switch connector.
9. Turn the ignition switch to ON (II).
10. Measure the voltage between the 3rd clutch transmission fluid pressure switch connector terminal and body ground.

**3RD CLUTCH TRANSMISSION FLUID
PRESSURE SWITCH CONNECTOR**

Wire side of female terminals

Fig. 127: Identifying Voltage Between 3rd Clutch Transmission Fluid Pressure Switch Connector Terminal And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the 3rd clutch transmission fluid pressure switch (see **3rd Clutch Transmission Fluid Pressure Switch Replacement**), then go to step 20.

NO - Go to step 11.

11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C38 and the 3rd clutch transmission fluid pressure switch connector terminal.

Fig. 128: Identifying Continuity Between PCM Terminal C38 And 3rd Clutch Transmission Fluid Pressure Switch Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

and the PCM. If the connections are OK, go to step 15.

NO - Repair open in the wire between PCM connector terminal C38 and the 3rd clutch transmission fluid pressure switch, then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Drive the vehicle in 3rd gear in M for at least 2 seconds, then upshift to 4th gear, and drive for at least 2 seconds. Slow down and stop the wheels.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0848 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0848 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does theHDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Drive the vehicle in 3rd gear in M for at least 2 seconds, then upshift to, and drive for at least 2 seconds. Slow down and stop the wheels.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0848 indicated?

YES - Check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0848 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 3rd clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P0872: Short in 4th Clutch Transmission Fluid Pressure Switch Circuit, or 4th Clutch Transmission Fluid Pressure Switch Stuck ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Clear the DTC with the HDS.
2. Check the 4th Pressure Switch signal with the HDS in the A/T data list when not in 4th gear.

Is the 4th Pressure Switch OFF?

YES - Go to step 3.

NO - Go to step 6.

3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Drive the vehicle in 5th gear in M for at least 2 seconds.
5. Monitor the OBD STATUS for P0872 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 6.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the OP4SW wire for an intermittent short to ground between the 4th clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

6. Turn the ignition switch to LOCK (0).
7. Disconnect the 4th clutch transmission fluid pressure switch connector.
8. Turn the ignition switch to ON (II).
9. Check the 4th Pressure Switch signal with the HDS in the A/T data list.

Is the 4th Pressure Switch OFF?

YES - Replace the 4th clutch transmission fluid pressure switch (see **4th Clutch Transmission Fluid Pressure Switch Replacement**), then go to step 19.

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector C (49P).
13. Check for continuity between PCM connector terminal C37 and body ground.

PCM CONNECTOR C (49P)

Terminal side of female terminals

Fig. 129: Identifying Continuity Between PCM Connector Terminal C37 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C37 and the 4th clutch transmission fluid pressure switch, then go to step 19.

NO - Go to step 14.

14. Reconnect all connectors.
15. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
16. Drive the vehicle in 4th gear in M for at least 2 seconds, then upshift to 5th gear, and drive for at least 2 seconds.
17. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0872 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 18.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

18. Monitor the OBD STATUS for P0872 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 16 and recheck.

19. Clear the DTC with the HDS.
20. Drive the vehicle in 4th gear in M for at least 2 seconds, then upshift to 5th gear, and drive for at least 2 seconds.
21. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0872 indicated?

YES - Check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO - Go to step 22.

22. Monitor the OBD STATUS for P0872 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 21, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0873: Open in 4th Clutch Transmission Fluid Pressure Switch Circuit, or 4th Clutch Transmission Fluid Pressure Switch Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).

3. Drive the vehicle in 4th gear in M, and check with the HDS in the A/T data list that the SHIFT COMMAND indicates 4th.
4. Check the 4th Pressure Switch signal with the HDS in the A/T data list.

Is the 4th Pressure Switch ON?

YES - Go to step 5.

NO - Go to step 7.

5. Drive the vehicle in 4th gear in M for at least 2 seconds.
6. Monitor the OBD STATUS for P0873 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 4th clutch transmission fluid pressure switch and the PCM. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect the 4th clutch transmission fluid pressure switch connector.
9. Turn the ignition switch to ON (II).
10. Measure the voltage between the 4th clutch transmission fluid pressure switch connector terminal and body ground.

**4TH CLUTCH TRANSMISSION FLUID
PRESSURE SWITCH CONNECTOR**

Wire side of female terminals

Fig. 130: Identifying Voltage Between 4th Clutch Transmission Fluid Pressure Switch Connector Terminal And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Replace the 4th clutch transmission fluid pressure switch (see **4th Clutch Transmission Fluid Pressure Switch Replacement**), then go to step 20.

NO - Go to step 11.

11. Turn the ignition switch to LOCK (0).
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C37 and the 4th clutch transmission fluid pressure switch connector terminal.

Fig. 131: Identifying Continuity Between PCM Terminal C37 And 4th Clutch Transmission Fluid Pressure Switch Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM. If the connections are OK, go to step 15.

NO - Repair open in the wire between PCM connector terminal C37 and the 4th clutch transmission fluid pressure switch, then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Drive the vehicle in 4th gear in M for at least 2 seconds, then upshift to 5th gear, and drive for at least 2 seconds.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0873 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

19. Monitor the OBD STATUS for P0873 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Drive the vehicle in 4th gear in M for at least 2 seconds, then upshift to, and drive for at least 2 seconds.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0873 indicated?

YES - Check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0873 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the 4th clutch transmission fluid pressure switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P0957: Short in Transmission Gear Selection Switch Circuit, or Transmission Gear Selection Switch Stuck ON

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Shift to P.

3. Check the SS Mode Switch signal with the HDS in the A/T data list.

Is the SS Mode Switch ON?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check the SS Mode Switch wire for an intermittent short to ground between the transmission gear selection switch and the PCM.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission gear selection switch/ park pin switch/A/T gear position indicator panel light connector at the shift lever bracket.
6. Turn the ignition switch to ON (II).
7. Check the SS Mode Switch signal input with the HDS in the A/T data list.

Is the SS Mode Switch ON?

YES - Go to step 8.

NO - Replace the transmission gear selection switch (see TRANSMISSION GEAR SELECTION SWITCH TEST), then go to step 19.

8. Turn the ignition switch to LOCK (0).
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector A (49P).
11. Check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminal No. 3 and body ground.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION

Is there continuity?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Repair short in the wire between PCM connector terminal A47 and the transmission gear selection switch, then go to step 19.

NO - Go to step 12.

12. Reconnect all connectors.
13. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
14. Start the engine in P, wait for at least 10 seconds, then shift to M.
15. Push the shift lever toward upshift position (+) slowly, and release it; repeat this test 10 times or more.
16. Pull the shift lever toward downshift position (-) slowly, and release it; repeat this test 10 times or more.
17. Check for Temporary DTCs or DTCs with the HDS.

Is DTC P0957 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for P0957 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 14 and recheck.

19. Clear the DTC with the HDS.
20. Start the engine in P, wait for at least 10 seconds, then shift to M.
21. Push the shift lever toward upshift position (+) slowly, and release it; repeat this test 10 times or more.
22. Pull the shift lever toward downshift position (-) slowly, and release it; repeat this test 10 times or more.
23. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0957 indicated?

YES - Check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Go to step 24.

24. Monitor the OBD STATUS for P0957 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 23, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0958: Open in Transmission Gear Selection Switch Circuit, or Transmission Gear Selection Switch Stuck OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II).
2. Shift to M.
3. Check the SS Mode Switch signal with the HDS in the A/T data list.

Is the SS Mode Switch OFF?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the transmission gear selection switch and the PCM.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission gear selection switch / park pin switch/A/T gear position indicator panel light connector at the shift lever bracket.
6. Check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminals No. 2 and No. 3.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION
INDICATOR PANEL LIGHT CONNECTOR**

Terminal side of male terminals

Fig. 133: Identifying Continuity Between Transmission Gear Selection Switch Connector Terminals No 2 And 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity while the shift lever is in M, and no continuity when the shift lever is in any position other than M?

YES - Go to step 7.

NO - Replace the transmission gear selection switch (see **TRANSMISSION GEAR SELECTION SWITCH TEST**), then go to step 20.

7. Turn the ignition switch to ON (II).
8. Measure the voltage between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminal No. 3 and body ground.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION
INDICATOR PANEL LIGHT CONNECTOR**

Wire side of female terminals

Fig. 134: Identifying Voltage Between Transmission Gear Selection Switch Connector Terminal No 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair open in the wire between transmission gear selection switch/park pin switch/ A/T gear position indicator panel light connector and ground (G503), or repair poor ground (G503), then go to step 20.

NO - Go to step 9.

9. Turn the ignition switch to LOCK (0).
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector A (49P).
12. Check for continuity between PCM connector terminal A47 and transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminal No. 3.

Fig. 135: Identifying Continuity Between PCM Terminal A47 And Transmission Gear Selection Switch Terminal 3

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair open in the wire between PCM connector terminal A47 and the transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector, then go to step 20.

NO - Go to step 13.

13. Reconnect all connectors.
14. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
15. Start the engine in P, wait for at least 10 seconds, then shift to M.
16. Push the shift lever toward upshift position (+) slowly, and release it; repeat this test 10 times or more.
17. Pull the shift lever toward downshift position (-) slowly, and release it; repeat this test 10 times or more.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0958 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

19. Monitor the OBD STATUS for P0958 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 15 and recheck.

20. Clear the DTC with the HDS.
21. Start the engine in P, wait for at least 10 seconds, then shift to M.
22. Push the shift lever toward upshift position (+) slowly, and release it; repeat this test 10 times or more.
23. Pull the shift lever toward downshift position (-) slowly, and release it; repeat this test 10 times or more.
24. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0958 indicated?

YES - Check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1.

NO - Go to step 25.

25. Monitor the OBD STATUS for P0958 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission gear selection switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0962: Problem in A/T Clutch Pressure Control Solenoid Valve A Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check that DTC P0962 recurs.

Is DTC P0962 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Clutch Pressure Control (Linear) Solenoid A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

Is the result NORMAL?

YES - Go to step 5.

NO - Go to step 7.

5. In the Clutch Pressure Control Solenoid Valve control menu, select Clutch Pressure Control Valve A at 1.0 A.
6. Monitor the OBD STATUS for P0962 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect A/T clutch pressure control solenoid valve A connector.
9. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE A CONNECTOR**

Terminal side of male terminals

Fig. 136: Identifying Resistance Between Clutch Pressure Control Solenoid Valve A Connector Terminals 1 And 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES - Go to step 10.

NO - Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**), then go to step 26.

10. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE A CONNECTOR**

Wire side of female terminals

Fig. 137: Identifying Continuity Between Clutch Pressure Control Solenoid Valve A Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between A/T clutch pressure control solenoid valve A and ground (G101), or repair poor ground (G101), then go to step 26.

11. Disconnect PCM connector C (49P).

12. Hook up a voltmeter between AT clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.
13. Check for continuity between PCM connector terminal C21 and A/T clutch pressure control solenoid valve A connector terminal No. 1.

Fig. 138: Identifying Continuity Between PCM Terminal C21 And Clutch Pressure Control Solenoid Valve A Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Check for open or short in the wire between PCM connector terminal C21 and A/T clutch pressure control solenoid valve A, if the wiring is OK, go to step 14.

14. Turn the ignition switch to LOCK (0).
15. Jump the SCS line with the HDS.
16. Disconnect PCM connectors B (49P) and C (49P).
17. Turn the ignition switch to ON (II).
18. Measure the voltage between PCM connector terminals B2 and B41 or C41.

Fig. 139: Identifying Voltage Between PCM Connector Terminals B2 And B41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 21.

NO - Go to step 19.

19. Turn the ignition switch to LOCK (0).
20. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 140: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal B2 and the under-dash fuse/relay box, then go to step 26.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 26.

21. Reconnect all connectors.
22. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
23. Start the engine.
24. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0962 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Go to step 25.

25. Monitor the OBD STATUS for P0962 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 24, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 23 and recheck.

26. Clear the DTC with the HDS.
27. Start the engine.
28. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0962 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for P0962 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 28, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 27 and recheck.

DTC P0963: Problem in A/T Clutch Pressure Control Solenoid Valve A

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

2. Start the engine.
3. Check that DTC P0963 recurs.

Is DTC P0963 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Clutch Pressure Control (Linear) Solenoid A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

Is the result NORMAL?

YES - Go to step 5.

NO - Go to step 7.

5. In the Clutch Pressure Control Solenoid Valve control menu, select Clutch Pressure Control Solenoid Valve A at 0.2 A.
6. Monitor the OBD STATUS for P0963 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect A/T clutch pressure control solenoid valve A connector.
9. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE A CONNECTOR**

Terminal side of male terminals

Fig. 141: Identifying Resistance Between Clutch Pressure Control Solenoid Valve A Terminals No 1 And 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES - Go to step 10.

NO - Replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**), then go to step 16.

10. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE A CONNECTOR**

Wire side of female terminals

Fig. 142: Identifying Continuity Between Clutch Pressure Control Solenoid Valve A Terminal 2 And Body Ground

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between A/T clutch pressure control solenoid valve A and ground (G101), or repair poor ground (G101), then go to step 16.

11. Reconnect the A/T clutch pressure control solenoid valve A connector.
12. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
13. Start the engine.
14. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0963 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Go to step 15.

15. Monitor the OBD STATUS for P0963 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 13 and recheck.

16. Clear the DTC with the HDS.
17. Start the engine.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0963 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0963 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

DTC P0966: Problem in A/T Clutch Pressure Control Solenoid Valve B Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

2. Start the engine.
3. Check that DTC P0966 recurs.

Is DTC P0966 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Clutch Pressure Control (Linear) Solenoid B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

Is the result NORMAL?

YES - Go to step 5.

NO - Go to step 7.

5. In the Clutch Pressure Control Solenoid Valve control menu, select Clutch Pressure Control Solenoid Valve B at 1.0 A.
6. Monitor the OBD STATUS for P0966 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect A/T clutch pressure control solenoid valve B connector.
9. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between A/T clutch pressure control solenoid valve B and ground (G101), or repair poor ground (G101), then go to step 26.

11. Disconnect PCM connector B (49P).
12. Hook up a voltmeter between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.
13. Check for continuity between PCM connector terminal B10 and A/T clutch pressure control solenoid valve B connector terminal No. 1.

Fig. 145: Identifying Continuity Between PCM Terminal B10 And Clutch Pressure Control Solenoid Valve B Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Check for open or short in the wire between PCM connector terminal B10 and A/T clutch pressure control solenoid valve B, if the wiring is OK, go to step 14.

14. Turn the ignition switch to LOCK (0).
15. Jump the SCS line with the HDS.
16. Disconnect PCM connectors B (49P) and C (49P).
17. Turn the ignition switch to ON (II).
18. Measure the voltage between PCM connector terminals B2 and B41 or C41.

Fig. 146: Identifying Voltage Between PCM Connector Terminals B2 And B41

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 21.

NO - Go to step 19.

19. Turn the ignition switch to LOCK (0).
20. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 147: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal B2 and the under-dash fuse/relay box, then go to step 26.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 26.

21. Reconnect all connectors.
22. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
23. Start the engine.
24. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0966 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 25.

25. Monitor the OBD STATUS for P0966 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 24, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 23 and recheck.

26. Clear the DTC with the HDS.
27. Start the engine.
28. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0966 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve Band the PCM, then go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for P0966 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 28, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 27 and recheck.

DTC P0967: Problem in A/T Clutch Pressure Control Solenoid Valve B

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check that DTC P0967 recurs.

Is DTC P0967 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Clutch Pressure Control (Linear) Solenoid B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

Is the result NORMAL?

YES - Go to step 5.

NO - Go to step 7.

5. In the Clutch Pressure Control Solenoid Valve control menu, select Clutch Pressure Control Solenoid Valve B at 0.2 A.
6. Monitor the OBD STATUS for P0967 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect A/T clutch pressure control solenoid valve B connector.
9. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE B CONNECTOR**

Terminal side of male terminals

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between A/T clutch pressure control solenoid valve C and ground (G101), or repair poor ground (G101), then go to step 16.

11. Reconnect the A/T clutch pressure control solenoid valve B connector.
12. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
13. Start the engine.
14. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0967 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 15.

15. Monitor the OBD STATUS for P0967 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED ?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 14, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 13 and recheck.

16. Clear the DTC with the HDS.
17. Start the engine.
18. Check for Temporary DTC(s) or DTC with the HDS.

Is DTC P0967 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0967 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 18, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

DTC P0970: Problem in A/T Clutch Pressure Control Solenoid Valve C Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check that DTC P0970 recurs.

Is DTC P0970 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Clutch Pressure Control (Linear) Solenoid C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

Is the result NORMAL?

YES - Go to step 5.

NO - Go to step 7.

5. In the Clutch Pressure Control Solenoid Valve control menu, select Clutch Pressure Control Solenoid Valve C at 1.0 A.
6. Monitor the OBD STATUS for P0970 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect A/T clutch pressure control solenoid valve C connector.
9. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

Is there battery voltage?

YES - Go to step 21.

NO - Go to step 19.

19. Turn the ignition switch to LOCK (0).
20. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 154: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 18 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal B2 and the under-dash fuse/relay box, then go to step 26.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 26.

21. Reconnect all connectors.
22. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
23. Start the engine.
24. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0970 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 25.

25. Monitor the OBD STATUS for P0970 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 24, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

(see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 23 and recheck.

26. Clear the DTC with the HDS.
27. Start the engine.
28. Check for Temporary DTCs or DTCs with the HDS..

Is DTC P0970 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to step 1.

NO - Go to step 29.

29. Monitor the OBD STATUS for P0970 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 28, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 27 and recheck.

DTC P0971: Problem in A/T Clutch Pressure Control Solenoid Valve C

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine.
3. Check that DTC P0971 recurs.

Is DTC P0971 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Clutch Pressure Control (Linear) Solenoid C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

Is the result NORMAL?

YES - Go to step 5.

NO - Go to step 7.

5. In the Clutch Pressure Control Solenoid Valve control menu, select Clutch Pressure Control Solenoid Valve C at 0.2 A.
6. Monitor the OBD STATUS for P0971 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Disconnect A/T clutch pressure control solenoid valve C connector.
9. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE C CONNECTOR**

Terminal side of male terminals

Fig. 155: Identifying Resistance Between Clutch Pressure Control Solenoid Valve C Terminals 1 And 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 3-10 ohms?

YES - Go to step 10.

NO - Replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C REPLACEMENT**), then go to step 16.

10. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2 and body ground.

**A/T CLUTCH PRESSURE CONTROL
SOLENOID VALVE C CONNECTOR**

Wire side of female terminals

Fig. 156: Identifying Continuity Between Clutch Pressure Control Solenoid Valve C Terminal 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair open in the wire between A/T clutch pressure control solenoid valve C and ground (G101), or repair poor ground (G101), then go to step 16.

11. Reconnect A/T clutch pressure control solenoid valve C connector.
12. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
13. Start the engine.
14. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0971 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 15.

15. Monitor the OBD STATUS for P0971 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 14, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 13 and recheck.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

16. Clear the DTC with the HDS.
17. Start the engine.
18. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0971 indicated?

YES - Check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0971 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at A/T clutch pressure control solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

DTC P0973: Short in Shift Solenoid Valve A Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and the brake pedal pressed with shifting from P to R.
3. Check that DTC P0973 recurs.

Is DTC P0973 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid A in the Miscellaneous Test Menu, and test shift solenoid valve A with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Start the engine, and the brake pedal pressed with shifting from P to R.
6. Monitor the OBD STATUS for P0973 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the SH A wire for an intermittent short to ground between shift solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C20 and C41 or B41.

Fig. 157: Identifying Resistance Between PCM Connector Terminals C20 And C41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES - Go to step 11.

NO - Go to step 19.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminals C20 and C41 or B41.

Fig. 158: Identifying Continuity Between PCM Connector Terminals C20 And C41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C20 and the shift solenoid harness connector, then go to step 24.

NO - Go to step 13.

13. Inspect shift solenoid valve A (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).

Is shift solenoid valve A OK?

YES - Go to step 14.

NO - Replace shift solenoid valve A or the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 18.

14. Disconnect PCM connector A (49P).
15. Turn the ignition switch to ON (II).
16. Measure the voltage between PCM connector terminals A1 and B41 or C41.

Fig. 159: Identifying Voltage Between PCM Connector Terminals A1 And B41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 19.

NO - Go to step 17.

17. Turn the ignition switch to LOCK (0).
18. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 160: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 10 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal A1 and the under-dash fuse/relay box, then go to step 24.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 24.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

19. Reconnect all connectors.
20. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
21. Start the engine, and shift to R.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0973 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0973 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

24. Clear the DTC with the HDS.
25. Start the engine, and shift to R.
26. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0973 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve A and the PCM, then go to step 1.

NO - Go to step 27.

27. Monitor the OBD STATUS for P0973 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 26, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 25 and recheck.

DTC P0974: Open in Shift Solenoid Valve A Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P. Wait for at least 1 second, then press the brake pedal, shift to R, and wait for at least 1 second.
3. Check that DTC P0974 recurs.

Is DTC P0974 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid A in the Miscellaneous Test Menu, and test shift solenoid valve A with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Start the engine in P. Wait for at least 1 second, then press the brake pedal, shift to R, and wait for at least 1 second.
6. Monitor the OBD STATUS for P0974 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve A and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).

10. Measure the resistance between PCM connector terminals C20 and C41 or B41.

Fig. 161: Identifying Resistance Between PCM Connector Terminals C20 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES - Go to step 15.

NO - Go to step 11.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminal C20 and shift solenoid harness connector terminal No. 3.

Fig. 162: Identifying Continuity Between PCM Connector Terminal C20 And Shift Solenoid Connector Terminal 3
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between PCM connector terminal C20 and the shift solenoid harness connector, then go to step 20.

13. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
14. Check for continuity between shift solenoid harness connector terminal No. 3 and the shift solenoid valve A connector terminal.

Fig. 163: Identifying Continuity Between Shift Solenoid Connector Terminal 3 And Shift Solenoid Valve A Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace shift solenoid valve A (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

NO - Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Start the engine in P. Wait for at least 1 second, then press the brake pedal, shift to R, and wait for at least 1 second.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0974 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

19. Monitor the OBD STATUS for P0974 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Start the engine in P. Wait for at least 1 second, then press the brake pedal, shift to R, and wait for at least 1 second.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0974 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve A and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0974 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve A and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P0976: Short in Shift Solenoid Valve B Circuit (Short)

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

2. Start the engine in P, and wait for at least 1 second.
3. Check that DTC P0976 recurs.

Is DTC P0976 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid B in the Miscellaneous Test Menu, and test shift solenoid valve B with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Start the engine in P, and wait for at least 1 second.
6. Monitor the OBD STATUS for P0976 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the SH B wire for an intermittent short to ground between shift solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C28 and C41 or B41.

Fig. 164: Identifying Resistance Between PCM Connector Terminals C28 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES - Go to step 11.

NO - Go to step 18.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminals C28 and C41 or B41.

Fig. 165: Identifying Continuity Between PCM Connector Terminals C28 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C28 and the shift solenoid harness connector, then go to step 24.

NO - Go to step 13.

13. Inspect shift solenoid valve B (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).

Is shift solenoid valve B OK?

YES - Go to step 14.

NO - Replace shift solenoid valve B or the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 24.

14. Turn the ignition switch to ON (II).
15. Measure the voltage between PCM connector terminals B3 and B41 or C41.

Fig. 166: Identifying Voltage Between PCM Connector Terminals B3 And B41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Go to step 16.

16. Turn the ignition switch to LOCK (0).
17. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 167: Identifying Continuity Between PCM Connector Terminal B41 And Body Ground
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 19 fuse in the under-dash fuse/relay box, and check the PGM-FI main relay 1. If the fuse and relay are OK, repair open in the wire between PCM connector terminal B3 and the under-dash fuse/relay box via the main relay, then go to step 24.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

poor ground (G101), then go to step 24.

18. Reconnect all connectors.
19. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
20. Start the engine.
21. Test-drive the vehicle so that it shifts from 1st thru 4th gear in D. Then continue driving for at least 1 second in 3rd or 4th gear.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0976 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0976 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 22, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

24. Clear the DTC with the HDS.
25. Start the engine.
26. Test-drive the vehicle so that it shifts from 1st thru 4th gear in D. Then continue driving for at least 1 second in 3rd or 4th gear.
27. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0976 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve B and the PCM, then go to step 1.

NO - Go to step 28.

28. Monitor the OBD STATUS for P0976 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the result indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 27, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 25 and recheck.

DTC P0977: Open in Shift Solenoid Valve B Circuit (Open)

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Test-drive the vehicle so that it shifts from 1st thru 4th gear in D. Then continue driving for at least 1 second in 3rd or 4th gear.
3. Check that DTC P0977 recurs.

Is DTC P0977 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid B in the Miscellaneous Test Menu, and test shift solenoid valve B with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Test-drive the vehicle so that it shifts from 1st gear to 4th gear in D, then run the vehicle in 3rd or 4th gear for at least 1 second.
6. Monitor the OBD STATUS for P0977 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor

connections or loose terminals at shift solenoid valve B and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C28 and C41 or B41.

Fig. 168: Identifying Resistance Between PCM Connector Terminals C28 And C41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES - Go to step 15.

NO - Go to step 11.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminal C28 and shift solenoid harness connector terminal No. 4.

Fig. 169: Identifying Continuity Between PCM Connector Terminal C28 And Shift Solenoid Connector Terminal 4

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between PCM connector terminal C28 and the shift solenoid harness connector, then go to step 15.

13. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
14. Check for continuity between shift solenoid harness connector terminal No. 4 and the shift solenoid valve B connector terminal.

Fig. 170: Identifying Continuity Between Shift Solenoid Connector Terminal 4 And Shift Solenoid Valve B Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace shift solenoid valve B (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

NO - Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Test-drive the vehicle so that it shifts from 1st thru 4th gear in D. Then continue driving for at least 1 second in 3rd or 4th gear.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0977 indicated?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0977 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve B and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Test-drive the vehicle so that it shifts from 1st to 4th gear in D, then drive the vehicle in 3rd or 4th gear for at least 1 second.
22. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0977 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve B and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0977 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve B and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P0979: Short in Shift Solenoid Valve C Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Clear the DTC with the HDS.
2. Test-drive the vehicle in 1st gear in D.
3. Check that DTC P0979 recurs.

Is DTC P0979 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid C in the Miscellaneous Test Menu, and test shift solenoid valve C with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Test-drive the vehicle in 1st gear in D.
6. Monitor the OBD STATUS for P0979 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the SH C wire for an intermittent short to ground between shift solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C39 and C41 or B41.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Fig. 171: Identifying Resistance Between PCM Connector Terminals C39 And C41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES - Go to step 11.

NO - Go to step 18.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminals C39 and C41 or B41.

Fig. 172: Identifying Continuity Between PCM Connector Terminals C39 And C41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C39 and the shift solenoid harness connector, then go to step 24.

NO - Go to step 13.

13. Inspect shift solenoid valve C (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND**

SHIFT SOLENOID WIRE HARNESS REPLACEMENT).

Is shift solenoid valve C OK?

YES - Go to step 14.

NO - Replace shift solenoid valve C or the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 24.

14. Turn the ignition switch to ON (II).
15. Measure the voltage between PCM connector terminals B3 and B41 or C41.

Fig. 173: Identifying Voltage Between PCM Connector Terminals B3 And B41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Go to step 16.

16. Turn the ignition switch to LOCK (0).
17. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body the ground.

Fig. 174: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 19 fuse in the under-dash fuse/relay box, and check the PGM-FI main relay 1. If the fuse and relay are OK, repair open in the wire between PCM connector terminal B3 and the under-dash fuse/relay box via the main relay, then go to step 24.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 24.

18. Reconnect all connectors.
19. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
20. Start the engine in P, and wait for at least 1 second.
21. Test-drive the vehicle in 1st gear in D for at least 1 second.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0979 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0979 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 22, go to the **INDICATED DTCs TROUBLESHOOTING**.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

24. Clear the DTC with the HDS.
25. Start the engine in P, and wait for at least 1 second.
26. Test-drive the vehicle in 1st gear in D for at least 1 second.
27. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0979 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve C and the PCM, then go to step 1.

NO - Go to step 28.

28. Monitor the OBD STATUS for P0979 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 27, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 25 and recheck.

DTC P0980: Open in Shift Solenoid Valve C Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P.
3. Check that DTC P0980 recurs.

Is DTC P0980 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid C in the Miscellaneous Test Menu, and test shift solenoid valve C with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Start the engine in P.
6. Monitor the OBD STATUS for P0980 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve C and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C39 and C41 or B41.

Terminal side of female terminals

Fig. 175: Identifying Resistance Between PCM Connector Terminals C39 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES - Go to step 15.

NO - Go to step 11.

11. Disconnect the shift solenoid harness connector.

12. Check for continuity between PCM connector terminal C39 and shift solenoid harness connector terminal No. 2.

Fig. 176: Identifying Continuity Between PCM Connector Terminal C39 And Shift Solenoid Connector Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between PCM connector terminal C39 and the shift solenoid harness connector, then go to step 20.

13. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
14. Check for continuity between shift solenoid harness connector terminal No. 2 and the shift solenoid valve C connector terminal.

Fig. 177: Identifying Continuity Between Shift Solenoid Terminal 2 And Shift Solenoid Valve C Connector Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is there continuity?

YES - Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

NO - Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Start the engine in P.
18. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P0980 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0980 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve C and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Start the engine in P.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0980 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve C and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0980 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve C and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P0982: Short in Shift Solenoid Valve D Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine in P.
3. Check that DTC P0982 recurs.

Is DTC P0982 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid D in the Miscellaneous Test Menu, and test shift solenoid valve D with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Start the engine in P.
6. Monitor the OBD STATUS for P0982 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check the SH D wire for an intermittent short to ground between shift solenoid valve D and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C9 and C41 or B41.

Fig. 178: Identifying Resistance Between PCM Connector Terminals C9 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there less than 12 ohms?

YES - Go to step 11.

NO - Go to step 19.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminals C9 and C41 or B41.

Fig. 179: Identifying Continuity Between PCM Connector Terminals C9 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal C9 and the shift solenoid harness connector, then go to step 24.

NO - Go to step 13.

13. Inspect shift solenoid valve D (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).

Is shift solenoid valve D OK?

YES - Go to step 14.

NO - Replace shift solenoid valve D or the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 24.

14. Disconnect PCM connector A (49P).
15. Turn the ignition switch to ON (II).
16. Measure the voltage between PCM connector terminals A1 and B41 or C41.

Fig. 180: Identifying Voltage Between PCM Connector Terminals A1 And B41
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 19.

NO - Go to step 17.

17. Turn the ignition switch to LOCK (0).
18. Check for continuity between PCM connector terminals B41 and body ground, and between C41 and body ground.

Fig. 181: Identifying Continuity Between PCM Connector Terminals B41 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for a blown No. 10 fuse in the under-dash fuse/relay box. If the fuse is OK, repair open in the wire between PCM connector terminal A1 and the under-dash fuse/relay box, then go to step 24.

NO - Repair open in the wires between PCM connector terminals B41, C41 and ground (G101), or repair poor ground (G101), then go to step 24.

19. Reconnect all connectors.
20. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
21. Start the engine in P.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0982 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0982 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 17, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO**

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

SUBSTITUTE THE PCM), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

24. Clear the DTC with the HDS.
25. Start the engine in P.
26. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0982 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve D and the PCM, then go to step 1.

NO - Go to step 27.

27. Monitor the OBD STATUS for P0982 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 21, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve D and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 20 and recheck.

DTC P0983: Open in Shift Solenoid Valve D Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Clear the DTC with the HDS.
2. Start the engine, and shift to N.
3. Check that DTC P0983 recurs.

Is DTC P0983 indicated?

YES - Go to step 7.

NO - Go to step 4.

4. Select Shift Solenoid D in the Miscellaneous Test Menu, and test shift solenoid valve D with the HDS.

Is a clicking sound heard?

YES - Go to step 5.

NO - Go to step 7.

5. Start the engine, and shift to N.
6. Monitor the OBD STATUS for P0983 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at shift solenoid valve D and the PCM. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Turn the ignition switch to LOCK (0).
8. Jump the SCS line with the HDS.
9. Disconnect PCM connectors B (49P) and C (49P).
10. Measure the resistance between PCM connector terminals C9 and C41 or B41.

Fig. 182: Identifying Resistance Between PCM Connector Terminals C9 And C41
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 12-25 ohms?

YES - Go to step 15.

NO - Go to step 11.

11. Disconnect the shift solenoid harness connector.
12. Check for continuity between PCM connector terminal C9 and shift solenoid harness connector terminal No. 1.

Fig. 183: Identifying Continuity Between PCM Connector Terminal C9 And Shift Solenoid Connector Terminal 1

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair open in the wire between PCM connector terminal C9 and the shift solenoid harness connector, then go to step 20.

13. Remove the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**).
14. Check for continuity between shift solenoid harness connector terminal No. 1 and the shift solenoid valve D connector terminal.

Fig. 184: Identifying Continuity Between Shift Solenoid Terminal 1 And Shift Solenoid Valve D Connector Terminal

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace shift solenoid valve D (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT,**

AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT), then go to step 20.

NO - Replace the shift solenoid harness (see **SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT**), then go to step 20.

15. Reconnect all connectors.
16. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
17. Start the engine, and shift to N.
18. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0983 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 19.

19. Monitor the OBD STATUS for P0983 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the result indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 18, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve D and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 17 and recheck.

20. Clear the DTC with the HDS.
21. Start the engine, and shift to N.
22. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P0983 indicated?

YES - Check for poor connections and loose terminals at shift solenoid valve D and the PCM, then go to step 1.

NO - Go to step 23.

23. Monitor the OBD STATUS for P0983 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Troubleshooting is complete. If any other DTCs were indicated on step 22, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at shift solenoid valve D and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 21 and recheck.

DTC P16C0: PCM A/T Control System Incomplete Updated

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is indicated when PCM updating is incomplete.

1. Update the A/T software in the PCM (see **PCM UPDATE**).
2. Check whether the DTC P16C0 is indicated in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P16C0 indicated?

YES - Replace the original PCM (see **PCM REPLACEMENT**).

NO - PCM updating is complete.

DTC P1717: Open in Transmission Range Switch ATP RVS Switch Circuit

NOTE:

- Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II).
2. Shift to P, R, and N. Then shift to R and wait at least 2 seconds. And check the A/T R Switch signal with the HDS in the A/T data list.

Is the A/T R Switch ON?

YES - Go to step 3.

NO - Check for proper transmission range switch installation (see **TRANSMISSION RANGE SWITCH TEST**), adjust the shift cable (see **SHIFT CABLE ADJUSTMENT**), then recheck.

3. Check the Reverse Switch (ATP RVS) signal with the HDS.

Is the Reverse Switch ON (ATP RVS)?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 4.

4. Turn the ignition switch to LOCK (0).
5. Disconnect the transmission range switch connector.
6. Check for continuity between transmission range switch connector terminal No. 6 and body ground.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 185: Identifying Continuity Between Transmission Range Switch Connector Terminal 6 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 7.

NO - Repair open in the wire between transmission range switch connector terminal No. 5 and ground (G101), or repair poor ground (G101), then go to step 15.

7. Turn the ignition switch to ON (II).
8. Measure the voltage between transmission range switch connector terminals No. 2 and No. 6.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 186: Identifying Voltage Between Transmission Range Switch Connector Terminals No 2 And No 6

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there voltage?

YES - Go to step 9.

NO - Repair open in the wire between PCM connector terminal C19 and the transmission range switch, then go to step 15.

9. Check for continuity between the No. 2 and No. 6 terminals at the transmission range switch.

TRANSMISSION RANGE SWITCH CONNECTOR

Terminal side of male terminals

Fig. 187: Identifying Continuity Between Transmission Range Switch Terminals No 2 And No 6
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity when the shift lever is in P, R, and N, and no continuity when the shift lever is in D and D3?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM. If the connections are OK, go to step 10.

NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 15.

10. Reconnect the transmission range switch connector.
11. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
12. Start the engine, and shift the shift lever slowly into P and R, then into N. Then, shift back into R, and wait at least 2 seconds.
13. Check for Temporary DTC(s) to DTCs with the HDS.

Is DTC P1717 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 14.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

14. Monitor the OBD STATUS for P1717 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 13, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 12 and recheck.

15. Clear the DTC with the HDS.
16. Start the engine, and shift the shift lever slowly into P and R, then into N. Then, shift back into R, and wait at least 2 seconds.
17. Check for Temporary DTC(s) to DTCs with the HDS.

Is DTC P1717 indicated?

YES - Check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1.

NO - Go to step 18.

18. Monitor the OBD STATUS for P1717 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other DTCs were indicated on step 17, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, return to step 16 and recheck.

DTC P1743: Problem in Shift Control System; Shift Valve E Stuck OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 7.

NO - Replace the ATF (see step 6 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P1743 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve E in the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), replace the main valve body, or replace the transmission, then go to step 7.

NO - Intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
8. Monitor the OBD STATUS for P1743 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - Return to step 7.

DTC P1744: Problem in Shift Control System; Shift Valve E Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Replace the transmission, then go to step 7.

NO - Replace the ATF (see step 6 on), then go to step 4.

4. Clear the DTC with the HDS.
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Monitor the OBD STATUS for P1744 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair shift valve E in the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), replace the main valve body, or replace the transmission, then go to step 7.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 4 and recheck.

7. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
8. Monitor the OBD STATUS for P1744 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - Return to step 7.

DTC P1745: Problem in Shift Control System; Servo Control Valve Stuck OFF or Servo Control Valve Stuck ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see step 5 on) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission, then go to step 7.

NO - Replace the ATF (see step 6 on), then go to step 4.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

4. Clear the DTC with the HDS.
5. Test-drive the vehicle in D through all five gears at speeds over 5 mph (8 km/h). Do not release the accelerator pedal until after the transmission shifts to 5th gear.
6. Monitor the OBD STATUS for P1745 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate FAILED?

YES - Repair the servo control valve in the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), servo valve in the regulator valve body (see **REGULATOR VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), or replace the main valve body, regulator valve body, then go to step 7, or replace the transmission.

NO - If the screen indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

7. Test-drive the vehicle in D through all five gears at speeds over 5 mph (8 km/h). Do not release the accelerator pedal until after the transmission shifts to 5th gear.
8. Monitor the OBD STATUS for P1745 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete.

NO - Return to step 7.

DTC P1780: Problem in Shift Control System

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
3. Check for other Temporary DTCs or DTCs indicated simultaneous with the code P1780.

NOTE: DTC P1780 means there is one or more A/T DTCs about the shift control system.

Are there other DTCs?

YES - Troubleshoot a problem as indicated by the DTC.

NO - Go to step 4.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

4. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
5. Test-drive the vehicle for several minutes with the shift lever in D, and let the transmission shift through all five gears.
6. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P1780 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 7.

7. Monitor the OBD STATUS for P1780 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 6, go to the **INDICATED DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 5 and recheck.

DTC P2122: Accelerator Pedal Position (APP) Sensor A (Throttle Position Sensor D) Circuit Low Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to ON (II).
3. Check whether DTC P2122 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P2122 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P2122 in the PGM-FI System (see **DTC P2122: APP SENSOR A (TP SENSOR D) CIRCUIT LOW VOLTAGE**).

NO - Go to step 4.

4. Check whether DTC P2122 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Is DTC P2122 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and wait at least 2 minutes.
7. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC P2122 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P2122 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 6 and recheck.

DTC P2123: Accelerator Pedal Position (APP) Sensor A (Throttle Position Sensor D) Circuit High Voltage Input

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to ON (II).
3. Check whether DTC P2123 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC P2123 indicated in the PGM-FI system?

YES - Troubleshoot for DTC P2123 in the PGM-FI System (see **DTC P2123: APP SENSOR A (TP SENSOR D) CIRCUIT HIGH VOLTAGE**).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

NO - Go to step 4.

4. Check whether DTC P2123 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC P2123 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and wait at least 2 minutes.
7. Check for DTC(s) in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC P2123 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for P2123 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the accelerator pedal position sensor A and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 6 and recheck.

DTC U0028: F-CAN Communication Circuit Error (F-CAN Bus OFF)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to ON (II).
3. Check whether DTC U0028 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC U0028 indicated in the PGM-FI system?

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

YES - Troubleshoot for DTC U0028 in the PGM-FI System (see **DTC U0028: F-CAN MALFUNCTION (BUS-OFF (PCM))**).

NO - Go to step 4.

4. Check whether DTC U0028 is indicated in the DTCs/ Freeze Data in A/T Mode Menu with the HDS.

Is DTC U0028 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and wait at least 2 minutes.
7. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC U0028 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for U0028 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the PCM and the connectors on the F-CAN circuit. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 6 and recheck.

DTC U0122: Lost Communication with VSA Modulator-Control Unit

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see **GENERAL TROUBLESHOOTING INFORMATION**).

1. Clear the DTC with the HDS.
2. Turn the ignition switch to ON (II).

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

3. Check whether DTC U0122 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC U0122 indicated in the PGM-FI system?

YES - Troubleshoot for DTC U0122 in the PGM-FI System (see **DTC U0122: F-CAN MALFUNCTION (PCM-VSA MODULATOR-CONTROL UNIT)**).

NO - Go to step 4.

4. Check for Temporary DTCs or DTCs with the HDS.

Is DTC U0122 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and wait at least 2 minutes.
7. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC U0122 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for U0122 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCs TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the VSA modulator-control unit the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 6 and recheck.

9. Check the communication line between the VSA modulator-control unit and the gauge control module with the HDS.

Is there a malfunction in the F-CAN line between the VSA modulator-control unit and the gauge control

module?

YES - Repair open in the wires between the VSA modulator-control unit connector and the CAN communication lines.

NO - Substitute a known-good VSA modulator-control unit (see **VSA MODULATOR-CONTROL UNIT REMOVAL AND INSTALLATION**), then recheck. If the symptom/indication goes away with a known-good VSA modulator-control unit, replace the original VSA modulator-control unit.

DTC U0155: Lost Communication with Gauge Control Module

NOTE: **Before you troubleshoot, record all freeze data and any on-board snapshot, and review General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTC with the HDS.
2. Turn the ignition switch to ON (II).
3. Check whether DTC U0155 is indicated in the DTCs/ Freeze Data in PGM-FI Mode Menu with the HDS.

Is DTC U0155 indicated in the PGM-FI system?

YES - Troubleshoot for DTC U0155 in the PGM-FI System (see **DTC U0155: F-CAN MALFUNCTION (PCM-GAUGE CONTROL MODULE)**).

NO - Go to step 4.

4. Check whether the DTC U0155 is indicated in the DTCs/Freeze Data in A/T Mode Menu with the HDS.

Is DTC U0155 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time.

5. Update the A/T software in the PCM if it does not have the latest software (see **PCM UPDATE**), or substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**).
6. Start the engine, and wait at least 2 minutes.
7. Check for Temporary DTC(s) or DTCs with the HDS.

Is DTC U0155 indicated?

YES - If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1.

NO - Go to step 8.

8. Monitor the OBD STATUS for U0155 in the DTCs/ Freeze Data in A/T Mode Menu for a pass/fail.

Does the HDS indicate PASSED?

YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **PCM REPLACEMENT**). If any other DTCs were indicated on step 7, go to the **INDICATED DTCS TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the gauge control module and the PCM. If the PCM was updated, substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**), then recheck. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, return to step 6 and recheck.

ROAD TEST

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Apply the parking brake, and block all four wheels. Start the engine, then shift to D while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.
3. Repeat step 2 in all shift lever positions.
4. Connect the HDS to the DLC (A), and go to the A/T data list. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

Fig. 188: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Prepare the HDS to take a HIGH SPEED SNAPSHOT (refer to the HDS user's guide for more details if needed):
 - Select High Speed icon.
 - Select these parameters:
 - Vehicle Speed
 - Output Shaft (Countershaft) Speed

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

- Input Shaft (Mainshaft) Speed (rpm)
 - Engine Speed
 - Relative TP Sensor
 - APP Sensor A
 - ATF Temp Sensor
 - Battery Voltage
 - Shift Control
 - Brake Switch
 - Set the Trigger Type to Parameter.
 - Adjust the Parameter setting to APP Sensor A above 1.2 V.
 - Set the recording time to 60 seconds.
 - Set the trigger point to -30 seconds.
6. Find a suitable level road. When you are ready to do the test, press OK on the HDS.
 7. Monitor the HDS and accelerate quickly until APP Sensor A reads 1.2 V. Maintain a steady throttle until the transmission shifts to 5th gear, then slow the vehicle and come to a stop.
 8. Save the snapshot if the entire event was recorded or increase the recording time setting as necessary and repeat step 7.
 9. Adjust the parameter setting to 2.49 V. Test-drive the vehicle again. While monitoring the HDS, accelerate quickly until APP Sensor A reads 2.49 V. Maintain a steady throttle until the transmission shifts to 5th gear (or reasonable speed), then slow the vehicle and come to a stop.
 10. Save the snapshot if the entire event was recorded or increase the recording time setting as necessary and repeat step 9.
 11. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the transmission shifts to 3rd gear, then slow to a stop, and save the snapshot.
 12. Review each snapshot individually, and compare the Shift Command, the APP Sensor A voltage, and the Vehicle Speed to the following table.

Upshift: D Position

VOLTAGE REFERENCE

APP sensor voltage: 1.2V	
1st-->2nd	9-13 mph (16-20 km/h)
2nd-->3rd	17-21 mph (28-34 km/h)
3rd-->4th	25-31 mph (40-48 km/h)
4th-->5th	40-48 mph (65-75 km/h)
Lock-up ON	47-53 mph (76-84 km/h)
APP sensor voltage: 2.49 V	
1st-->2nd	22-26 mph (36-42 km/h)
2nd-->3rd	45-53 mph (73-83 km/h)
3rd-->4th	70-78 mph (113-125 km/h)

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

4th-->5th	99-109 mph (159-175 km/h)
Lock-up ON	100-110 mph (160-176 km/h)
Fully-opened throttle APP sensor voltage: 4.42 V	
1st-->2nd	36-42 mph (57-67 km/h)
2nd-->3rd	65-73 mph (104-116 km/h)
3rd-->4th	99-109 mph (158-174 km/h)

Downshift: D Position (reference)

VOLTAGE REFERENCE

APP sensor A voltage: 1.2 V	
Lock-up OFF	44-50 mph (71-79 km/h)
5th-->4th	35-41 mph (55-65 km/h)
4th-->3rd	17-21 mph (28-34 km/h)
3rd-->2nd	7-11 mph (11-17 km/h)
APP sensor A voltage: 2.49 V	
Lock-up OFF	65-73 mph (104-116 km/h)
Fully-opened throttle APP sensor A voltage: 4.42 V	
5th-->4th	128-140 mph (206-224 km/h)
4th-->3rd	78-88 mph (126-140 km/h)
3rd-->2nd	54-58 mph (87-99 km/h)
3rd-->1st	26-32 mph (42-52 km/h)

13. Drive the vehicle in 4th or 5th gear in the sequential sportshift mode in M, then downshift to 2nd gear. The vehicle should immediately begin to slow down from engine braking.
14. Shift to R. Then, from a full stop, accelerate to full throttle, and check for abnormal noise and clutch slippage.
15. Park the vehicle on a slope (about 16 degrees), apply the brake, and shift into P. Release the brake; the vehicle should not move.

NOTE: Always use the brake to hold the vehicle when stopped on an incline in gear. Depending on the grade of the incline, the vehicle could roll backwards if the brake is released.

STALL SPEED TEST

1. Make sure the transmission fluid is filled to the proper level (see ATF LEVEL CHECK).
2. Apply the parking brake, and block all four wheels.
3. Connect the HDS to the DLC (A), and go to the A/T data list. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see DLC CIRCUIT TROUBLESHOOTING).

Fig. 189: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Make sure the A/C switch is OFF.
5. After the engine has warmed up to normal operating temperature (the radiator fan comes on), shift to D.
6. Firmly press and hold the brake pedal then, while still holding the brake pedal, press the accelerator pedal for six to eight seconds, and note max engine speed. Do not move the shift lever while raising the engine speed.
7. Allow 2 minutes for cooling, then repeat the test in R.

NOTE:

- Do not test stall speed for more than 10 seconds at a time.
- Stall speed tests should be used for diagnostic purposes only.
- Stall speed should be the same in D and R.
- Do not test stall speed with A/T pressure gauges installed.

Stall Speed rpm:

Specification: 1,950 rpm

Service Limit: 1,800-2,100 rpm

8. If any of the stall speeds are out of the service limit, the possible problems and probable causes are listed in the table.

PROBLEM SYMPTOM CHART

Problem	Probable causes
Stall speed rpm high in D and R	• ATF pump output low • Regulator valve stuck • Slipping clutch
Stall speed rpm high in R	Slippage of 5th clutch

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Stall speed rpm low in D and R

- Engine output low
- Engine throttle valve closed
- Torque converter one-way clutch slipping

PRESSURE TEST

Special Tools Required

- A/T oil pressure gauge set 07406-0020400 or 07406-0020401
 - A/T pressure hose, 2,210 mm 07MAJ-PY4011A
 - A/T pressure hose adapter 07MAJ-PY40120
1. Make sure the transmission fluid is filled to the proper level (see **ATF LEVEL CHECK**).
 2. Raise the vehicle on a lift, and make sure it is securely supported.
 3. Allow all four wheels to rotate freely.
 4. Remove the transmission undercover (A) and splash shield (B).

Fig. 190: Identifying Transmission Undercover And Splash Shield With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the damper from the front subframe.

Fig. 191: Identifying Damper With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect the HDS to the DLC (A), and go to the A/T data list. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

Fig. 192: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the oil pressure gauge to the line pressure inspection hole (A). Do not allow dust or other foreign particles to enter the hole while connecting the gauge.

**A/T OIL PRESSURE
GAUGE SET W/PANEL**
07406-0020400 or 07406-0020401

**A/T PRESSURE
HOSE, 2,210 mm**
07MAJ-PY4011A

**A/T PRESSURE
HOSE ADAPTER**
07MAJ-PY40120

Fig. 193: Identifying A/T Oil Pressure Gauge Set And Line Pressure Inspection Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Start the engine in P, and warm it up to normal operating temperature (the radiator fan comes on).
9. Measure the line pressure at the line pressure inspection port (A) in P or N while holding the engine speed at 2,000 rpm.

NOTE: Higher pressure may be indicated if measurements are made in the shift lever position other than P or N.

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit
Line (A)	950-1,010 kPa (9.7-10.3 kgf/cm ² , 138-147 psi)	900 kPa (9.2 kgf/cm ² , 131 psi)

10. Turn the engine off, then disconnect the oil pressure gauge from the line pressure inspection port.
11. Install the sealing bolt to the line pressure inspection port with a new sealing washer, and tighten the bolt to 18 N.m (1.8 kgf.m, 13 lbf.ft). Do not reuse the old sealing washer.
12. Connect the oil pressure gauge to the 1st clutch pressure inspection port (B) and the 1st-hold clutch

pressure inspection port (C).

Fig. 194: Identifying 1st Clutch Pressure Inspection Port And 1st-Hold Clutch Pressure Inspection Port

Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the air cleaner housing and intake air duct, and connect the oil pressure gauge to the 2nd clutch pressure inspection port (D). Then temporarily install the air cleaner housing and intake air duct.

Fig. 195: Identifying 2nd Clutch Pressure Inspection Port

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Start the engine disable the VSA by pressing the VSA OFF switch, the shift in to P.
15. Shift into 1st gear, and measure the 1st clutch pressure at the 1st clutch pressure inspection port (B) and 1st-hold clutch pressure at the 1st-hold clutch pressure inspection port (C) while holding the engine speed at 2,000 rpm.
16. Upshift to 2nd gear by pushing the shift lever, and measure the 2nd clutch pressure at the 2nd clutch pressure inspection port (D) while holding the engine speed at 2,000 rpm.

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

	Standard	Service Limit
1st clutch (B) 2nd clutch (D)	940-1,020 kPa (9.6-10.4 kgf/cm ² , 137-148 psi)	890 kPa (9.1 kgf/cm ² , 130 psi)
1st-hold clutch (C)	680-760 kPa (6.9-7.7 kgf/cm ² , 98-110 psi)	630 kPa (6.4 kgf/cm ² , 91 psi)

17. Turn the engine off, remove the air cleaner housing and intake air duct, then disconnect the oil pressure gauges from the 1st clutch pressure, 1st-hold clutch pressure, and 2nd clutch pressure inspection ports.
18. Install the sealing bolts in the 1st clutch pressure, 1st-clutch hold clutch pressure, and 2nd clutch pressure inspection ports with new sealing washers, and tighten the bolts to 18 N.m (1.8 kgf.m, 13 lbf.ft). Do not reuse the old sealing washers.
19. Install the air cleaner housing and intake air duct.
20. Connect the oil pressure gauge to the 3rd clutch pressure inspection port (E) and the 5th clutch pressure inspection port (G).

Fig. 196: Identifying 3rd Clutch Pressure Inspection Port And 5th Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Connect the oil pressure gauge to the 4th clutch pressure inspection port (F).

Fig. 197: Identifying 4th Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Cancel the transmission 2nd-hold control mode with the HDS; select Pressure Assistance Mode in the Miscellaneous Test Menu of the A/T Mode Menu.
23. Start the engine, and shift to D3.
24. Measure the 3rd clutch pressure at the 3rd clutch pressure inspection port (D) while holding the engine speed at 2,000 rpm.
25. Shift to D, and measure the 4th clutch pressure at the 4th clutch pressure inspection port (E) while holding the engine speed at 2,000 rpm.
26. Measure the 5th clutch pressure at the 5th clutch pressure inspection port (F) while holding the engine speed at 2,000 rpm.

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit
3rd clutch (E)	940-1,020 kPa (9.6-10.4 kgf/cm ² , 137-148 psi)	890 kPa (9.1 kgf/cm ² , 130 psi)
4th clutch (F)		
5th clutch (G)		

27. Bring the engine back to an idle, then apply the brake pedal to stop the wheels from rotating.
28. Shift to R, then release the brake pedal. Raise the engine speed to 2,000 rpm, and measure the 5th clutch pressure at the 5th clutch pressure inspection port (G).

FLUID PRESSURE REFERENCE

Pressure	Fluid Pressure	
	Standard	Service Limit
5th clutch (G) in R	940-1,020 kPa (9.6-10.4 kgf/cm ² , 137-148 psi)	890 kPa (9.1 kgf/cm ² , 130 psi)

29. Turn the engine off, then disconnect the oil pressure gauges from the 3rd, 4th, and 5th clutch pressure inspection ports.
30. Install the sealing bolts in the 3rd, 4th, and 5th clutch pressure inspection ports with new sealing washers, and tighten the bolts to 18 N.m (1.8 kgf.m, 13 lbf.ft). Do not reuse the old sealing washers.
31. If any of the pressures are out of the service limit, the possible problems and probable causes are listed in the table.

PROBLEM SYMPTOM CHART

Problem	Probable causes
No or low line pressure	• Torque converter • ATF pump • Regulator valve • Torque converter check valve

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

	• Clogged ATF strainer
No or low 1st clutch pressure	• 1st clutch • O-rings
No or low 2nd clutch pressure	• 2nd clutch • O-rings
No or low 3rd clutch pressure	• 3rd clutch • O-rings
No or low 4th clutch pressure	• 4th clutch • O-rings
No or low 5th clutch pressure	• 5th clutch • O-rings
No or low 5th clutch pressure in R	• Servo valve • 5th clutch • O-rings
No or low 1st-hold clutch pressure	• 1st-hold clutch • O-rings

32. Install the damper on the front subframe.
33. Install the splash shield and transmission undercover.
34. Relive any VSA DTCs with the HDS, and clear them.

SHIFT SOLENOID VALVE TEST, REPLACEMENT, AND SHIFT SOLENOID WIRE HARNESS REPLACEMENT

1. Connect the HDS to the DLC (A).

Fig. 198: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Select Shift Solenoid A, B, C, and D in the Miscellaneous Test Menu on the HDS.

NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

3. Check that shift solenoid valves A, B, C, and D operate with the HDS. A clicking sound should be heard.
 - If a clicking sound is heard, the valves are OK.
 - If no clicking sound is heard, go to step 4, and test the solenoid valves.
4. Do the battery removal procedure(see **REMOVAL**).
5. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
6. Remove the intake air duct and air cleaner housing.
7. Remove the battery base and battery base bracket.
8. Remove the nuts securing the shift cable bracket (A).

Fig. 199: Identifying Shift Cable Bracket, Spring Clip/Washer, Control Pin, Bushing And Control Lever With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
10. Check the bushing (F) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).

11. Disconnect the transmission range switch connector (A), input shaft (mainshaft) speed sensor connector (B), output shaft (countershaft) speed sensor connector (C), 3rd clutch transmission fluid pressure switch connector (D), and ATF temperature sensor connector (E).

Fig. 200: Identifying Transmission Range Switch Connector And ATF Temperature Sensor Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the harness clamp (F) from the clamp bracket (G).
13. Disconnect the A/T clutch pressure control solenoid valve A connector (A), A/T clutch pressure control solenoid valve B connector (B), and shift solenoid harness connector (C).

Fig. 201: Identifying A/T Clutch Pressure Control Solenoid Valves Connectors With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the bolt securing the harness cover (D), and disconnect the 4th clutch transmission fluid pressure switch connector (E).
15. Remove the A/T clutch pressure control solenoid valve A and B, ATF pipes (C), and gasket (D).

Fig. 202: Identifying A/T Clutch Pressure Control Solenoid Valves And ATF Pipes With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Replace the gasket and O-rings (E) with new ones when installing the A/T clutch pressure control solenoid valve A and B.
17. Remove the solenoid valve cover (A), dowel pins (B), and gasket (C).

Fig. 203: Identifying Solenoid Valve Cover, Dowel Pins And Gasket With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Replace the gasket with a new one when installing the solenoid valve cover.
19. Disconnect the connectors from shift solenoid valve A, shift solenoid valve B, shift solenoid valve C, and shift solenoid valve D.

Fig. 204: Identifying Shift Solenoid Valves Connectors
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Measure the resistance of each shift solenoid valve between the connector terminal and body ground.

Standard: 12-25 ohms

- If the resistance is out of standard, go to step 23 and replace shift solenoid valve.
 - If the resistance is within the standard, go to step 21 and check the solenoid valve for a clicking sound.
21. Connect a jumper wire from the negative battery terminal to the body ground, and connect another jumper wire from the positive battery terminal to each solenoid valve terminal individually.
 - If a clicking sound is heard, go to step 22 and replace the shift solenoid harness.
 - If no clicking sound is heard, go to step 23 and replace the shift solenoid valve.
 22. Remove the shift solenoid harness connector (A), and replace it. Install a new O-ring (B) on the shift solenoid harness connector, and install the connector in the transmission housing, then go to step 29.

Fig. 205: Identifying Shift Solenoid Harness Connector And O-Ring With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Remove the mounting bolts, then remove the solenoid valves.

Fig. 206: Identifying Shift Solenoid Valves With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Install new O-rings (two O-rings per solenoid valve) (E) on each reused solenoid valves.

NOTE: A new solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided with it.

25. Install shift solenoid valve D (black connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the accumulator body.

NOTE: Do not hold the solenoid valve by the connector when installing the solenoid valve. Be sure to hold the solenoid valve body.

26. Install shift solenoid valve A (black connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the accumulator body.

NOTE: Do not install shift solenoid valve C before installing shift solenoid valve A. If shift solenoid valve C is installed before installing shift solenoid valve A, it may damage the hydraulic control system.

27. Install shift solenoid valve C (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the bracket of shift solenoid valve A.
28. Install shift solenoid valve B (brown connector) by holding the shift solenoid valve body; make sure the mounting bracket contacts the accumulator body.
29. Connect the harness terminals to the solenoids:
- RED wire connector to shift solenoid valve A.
 - ORN wire connector to shift solenoid valve B.
 - GRN wire connector to shift solenoid valve C.
 - YEL wire connector to shift solenoid valve D.
30. Install the shift solenoid valve cover, dowel pins, and a new gasket.
31. Install the new solenoid valve body gasket on the solenoid valve cover, and install the ATF pipes with their filter side into the transmission housing. Install the new O-rings over the ATF pipes.
32. Install A/T clutch pressure control solenoid valve A and B.
33. Secure the harness cover with the bolt.
34. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect it securely.
35. Apply molybdenum grease to the hole of the bushing in the shift cable end. Attach the shift cable end to the control lever, then insert the control pin into the control lever hole through the shift cable end, and secure the control pin with the spring clip/ washer.
36. Secure the shift cable bracket with the nuts.
37. Install the battery base bracket and battery base.
38. Install the air cleaner housing and intake air duct.
39. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
40. Do the battery installation procedure (see **INSTALLATION**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A TEST

1. Connect the HDS to the DLC (A).

Fig. 207: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Select Clutch Pressure Control (Linear) Solenoid A in the Miscellaneous Test Menu on the HDS.

NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see DLC CIRCUIT TROUBLESHOOTING).

3. Test A/T clutch pressure control solenoid valve A with the HDS.
 - If the valve tests OK, the test is complete. Disconnect the HDS.
 - If the valve does not test OK, follow the instructions on the HDS.
 - If the valve does not test OK, and the HDS does not determine the cause, go to step 4.
4. Do the battery removal procedure(see REMOVAL).
5. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
6. Remove the intake air duct and air cleaner housing.
7. Remove the battery base and battery base bracket.
8. Disconnect A/T clutch pressure control solenoid valve A connector.

Fig. 208: Identifying A/T Clutch Pressure Control Solenoid Valve A Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure A/T clutch pressure control solenoid valve A resistance at the connector terminals.

Standard: 3-10 ohms

- If the resistance is out of standard, replace A/T clutch pressure control solenoid valve A (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**).
 - If the resistance is within the standard, go to step 12.
10. Connect a jumper wire from the negative battery terminal to the solenoid valve A connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1.
 - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
 - If no clicking sound is heard, go to step 13.
 11. Remove the nuts securing the shift cable bracket (A).

Fig. 209: Identifying Spring Clip/Washer, Bushing, Control Pin, Shift Cable Bracket And Control Level With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
13. Check the bushing (F) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
14. Disconnect the transmission range switch connector (A), input shaft (mainshaft) speed sensor connector (B), output shaft (countershaft) speed sensor connector (C), 3rd clutch transmission fluid pressure switch connector (D), and ATF temperature sensor connector (E).

Fig. 210: Identifying Transmission Range Switch Connector And 3rd Clutch Transmission Fluid Pressure Switch Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the harness clamp (F) from the clamp bracket (G).
16. Disconnect A/T clutch pressure control solenoid valve A connector (A), A/T clutch pressure control solenoid valve B connector (B), and shift solenoid harness connector (C).

Fig. 211: Identifying A/T Clutch Pressure Control Solenoid Valves Connectors With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the bolt securing the harness cover (D), and disconnect the 4th clutch transmission fluid pressure switch connector (E).
18. Remove the A/T clutch pressure control solenoid valve A and B, ATF pipes (C), gasket (D), and O-rings (E).

Fig. 212: Identifying A/T Clutch Pressure Control Solenoid Valves And ATF Pipes With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check the fluid passage of the solenoid valve for contamination.
20. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve A connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve A moves.

Fig. 213: Identifying A/T Clutch Pressure Control Solenoid Valve A

Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Disconnect one of the jumper wires and check for valve movement at the fluid passage in the valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valves A and B.
22. Clean the mounting surface and fluid passage of the solenoid valve body and solenoid valve cover.
23. Install the new solenoid valve body gasket on the solenoid valve cover, and install the ATF pipes with the filter end in the transmission housing. Install the new O-rings over the ATF pipes.

24. Install A/T clutch pressure control solenoid valve A and B.
25. Secure the harness cover with the bolt.
26. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect it securely.
27. Apply molybdenum grease to the hole in the bushing in the shift cable end. Attach the shift cable end to the control lever, then insert the control pin into the control lever hole through the shift cable end, and secure the control pin with the spring clip/ washer.
28. Secure the shift cable bracket with the nuts.
29. Install the battery base bracket and battery base.
30. Install the air cleaner housing and intake air duct.
31. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket
32. Do the battery installation procedure(see **INSTALLATION**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B TEST

1. Connect the HDS to the DLC (A).

Fig. 214: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Select Clutch Pressure Control (Linear) Solenoid B in the Miscellaneous Test Menu on the HDS.

NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

3. Test A/T clutch pressure control solenoid valve B with the HDS.
 - If the valve tests OK, the test is complete. Disconnect the HDS.
 - If the valve does not test OK, follow the instructions on the HDS.
 - If the valve does not test OK, and the HDS does not determine the cause, go to step 4.
4. Do the battery removal procedure(see **REMOVAL**).

5. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
6. Remove the intake air duct and air cleaner housing.
7. Remove the battery base and battery base bracket.
8. Disconnect A/T clutch pressure control solenoid valve B connector.

Fig. 215: Identifying A/T Clutch Pressure Control Solenoid Valve B Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure A/T clutch pressure control solenoid valve B resistance at the connector terminals.

Standard: 3-10 ohms

- If the resistance is out of standard, replace A/T clutch pressure control solenoid valve B (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT**).
 - If the resistance is within the standard, go to step 12.
10. Connect a jumper wire from the negative battery terminal to the solenoid valve B connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1.
 - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
 - If no clicking sound is heard, go to step 13.
 11. Remove the nuts securing the shift cable bracket (A).

Fig. 216: Identifying Spring Clip/Washer, Bushing, Control Pin, Shift Cable End And Control Lever With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
13. Check the bushing (F) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
14. Disconnect the transmission range switch connector (A), input shaft (mainshaft) speed sensor connector (B), output shaft (countershaft) speed sensor connector (C), 3rd clutch transmission fluid pressure switch connector (D), and ATF temperature sensor connector (E).

Fig. 217: Identifying Transmission Range Switch Connector And Input Shaft (Mainshaft) Speed Sensor Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the harness clamp (F) from the clamp bracket (G).
16. Disconnect A/T clutch pressure control solenoid valve A connector (A), A/T clutch pressure control solenoid valve B connector (B), and shift solenoid harness connector (C).

Fig. 218: Identifying A/T Clutch Pressure Control Solenoid Valves Connectors With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the bolt securing the harness cover (D), and disconnect the 4th clutch transmission fluid pressure switch connector (E).
18. Remove A/T clutch pressure control solenoid valve A and B, ATF pipes (C), gasket (D), and O-rings (E).

Fig. 219: Identifying A/T Clutch Pressure Control Solenoid Valves And ATF Pipes With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check the fluid passage of the solenoid valve for contamination.
20. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve B connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve B moves.

Fig. 220: Identifying A/T Clutch Pressure Control Solenoid Valve B

Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Disconnect one of the jumper wires and check valve movement at the fluid passage in valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate, replace A/T clutch pressure control solenoid valve A and B.
22. Clean the mounting surface and fluid passage of the solenoid valve body and solenoid valve cover.
23. Install the new solenoid valve body gasket on the solenoid valve cover, and install the ATF pipes with the filter end in the transmission housing. Install the new O-rings over the ATF pipes.

24. Install A/T clutch pressure control solenoid valve A and B.
25. Secure the harness cover with the bolt.
26. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect it securely.
27. Apply molybdenum grease to the hole of the bushing in the shift cable end. Attach the shift cable end to the control lever, then insert the control pin into the control lever hole through the shift cable end, and secure the control pin with the spring clip/ washer.
28. Secure the shift cable bracket with the nuts.
29. Install the battery base bracket and battery base.
30. Install the air cleaner housing and intake air duct.
31. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
32. Do the battery installation procedure(see **INSTALLATION**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A AND B REPLACEMENT

1. Do the battery removal procedure(see **REMOVAL**).
2. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
3. Remove the intake air duct and air cleaner housing.
4. Remove the battery base and battery base bracket.
5. Remove the nuts securing the shift cable bracket (A).

Fig. 221: Identifying Shift Cable Bracket, Bushing, Control Pin, Shift Cable End And Control Lever With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
7. Check the bushing (F) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
8. Disconnect the transmission range switch connector (A), input shaft (mainshaft) speed sensor connector (B), output shaft (countershaft) speed sensor connector (C), 3rd clutch transmission fluid pressure switch connector (D), and ATF temperature sensor connector (E).

Fig. 222: Identifying Transmission Range Switch Connector And Output Shaft (Countershaft) Speed Sensor Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the harness clamp (F) from the clamp bracket (G).
10. Disconnect the A/T clutch pressure control solenoid valve A connector (A), A/T clutch pressure control solenoid valve B connector (B), and shift solenoid harness connector (C).

Fig. 223: Identifying A/T Clutch Pressure Control Solenoid Valves Connectors With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the bolt securing the harness cover (D), and disconnect the 4th clutch transmission fluid pressure switch connector (E).
12. Remove A/T clutch pressure control solenoid valve A and B, ATF pipes (C), gasket (D), and O-rings (E).

Fig. 224: Identifying A/T Clutch Pressure Control Solenoid Valves And ATF Pipes With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Check the fluid passage of the A/T clutch pressure control solenoid valve for dust or dirt, and clean the passage.
14. Install the new solenoid valve body gasket on the solenoid valve cover, and install the ATF pipes with the filter end in the transmission housing. Install the new O-rings over the ATF pipes.
15. Install A/T clutch pressure control solenoid valve A and B.
16. Secure the harness cover with the bolt.
17. Check the connectors for rust, dirt, or oil, clean, then connect it securely.
18. Apply molybdenum grease to the hole of the bushing in the shift cable end. Attach the shift cable end to the control lever, then insert the control pin into the control lever hole through the shift cable end, and secure the control pin with the spring clip/ washer.
19. Secure the shift cable bracket with the nuts.
20. Install the battery base bracket and battery base.
21. Install the air cleaner housing and intake air duct.
22. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
23. Do the battery installation procedure (see **INSTALLATION**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C TEST

1. Connect the HDS to the DLC (A).

Fig. 225: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Select Clutch Pressure Control (Linear) Solenoid C in the Miscellaneous Test Menu on the HDS.

NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

3. Test A/T clutch pressure control solenoid valve C with the HDS.
 - If the valve tests OK, the test is complete. Disconnect the HDS.
 - If the valve does not test OK, follow the instructions on the HDS.
 - If the valve does not test OK, and the HDS does not determine the cause, go to step 4.
4. Do the battery removal procedure (See **REMOVAL**).
5. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
6. Remove the intake air duct and air cleaner housing.
7. Remove the battery base and battery base bracket.
8. Disconnect A/T clutch pressure control solenoid valve C connector.

Fig. 226: Identifying A/T Clutch Pressure Control Solenoid Valve C Connector Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure A/T clutch pressure control solenoid valve C resistance at the connector terminals.

Standard: 3-10 ohms

- If the resistance is out of standard, replace A/T clutch pressure control solenoid valve C (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C REPLACEMENT**).
 - If the resistance is within the standard, go to step 12.
10. Connect a jumper wire from the negative battery terminal to the solenoid valve C connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1.
 - If a clicking sound is heard, the valve is OK. Reconnect the connector, and install all removed parts.
 - If no clicking sound is heard, go to step 13.
 11. Remove A/T clutch pressure control solenoid valve C.

Fig. 227: Identifying A/T Clutch Pressure Control Solenoid Valve C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the ATF joint pipes, O-rings, ATF pipe, and gasket.
13. Check the fluid passage of the solenoid valve for contamination.
14. Connect a jumper wire from the negative battery terminal to A/T clutch pressure control solenoid valve C connector terminal No. 2, and connect another jumper wire from the positive battery terminal to the connector terminal No. 1. Make sure A/T clutch pressure control solenoid valve C moves.

Fig. 228: Identifying A/T Clutch Pressure Control Solenoid Valve C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Disconnect one of the jumper wires and check valve movement at the fluid passage in valve body mounting surface. If the valve binds or moves sluggishly, or if the solenoid valve does not operate,

replace A/T clutch pressure control solenoid valve C.

16. Clean the mounting surface and fluid passage of the solenoid valve body and transmission housing.
17. Install the 8 x 53 mm ATF joint pipe (A) with the filter end into its mounting hole (B).

Fig. 229: Identifying ATF Joint Pipe

Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Check the height (A) of the 8x53 mm ATF joint pipe (B) between the top (C) of the pipe and solenoid valve body mounting surface (D). The height is about 7 mm (0.3 in.) If the height is over 7 mm (0.3 in.), push the pipe until it bottoms in the accumulator body.

Fig. 230: Identifying ATF Joint Pipe Height

Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Install the new gasket (A) on the transmission housing, and install the 8 x 34.5 mm ATF joint pipe (B) with the filter end into the transmission housing and 8 x 25.2 mm ATF pipe (D).

Fig. 231: Identifying ATF Joint Pipe And A/T Clutch Pressure Control Solenoid Valve C With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the new O-rings (E) over the ATF joint pipes.
21. Install A/T clutch pressure control solenoid valve C.
22. Check the connector for rust, dirt, or oil, then connect it securely.
23. Install the battery base bracket and battery base.
24. Install the air cleaner housing and intake air duct.
25. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
26. Do the battery installation procedure(See **INSTALLATION**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C REPLACEMENT

1. Do the battery removal procedure(See **REMOVAL**).
2. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
3. Remove the intake air duct and air cleaner housing.
4. Remove the battery base and battery base bracket.
5. Disconnect the A/T clutch pressure control solenoid valve C connector.

Fig. 232: Identifying A/T Clutch Pressure Control Solenoid Valve C
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove A/T clutch pressure control solenoid valve C.
7. Remove the ATF joint pipes, O-rings, ATF pipe, and gasket.
8. Clean the mounting surface and the fluid passage of the solenoid valve body and transmission housing.
9. Install the 8 x 53 mm ATF joint pipe (A) with the filter end into its mounting hole (B).

Fig. 233: Identifying ATF Joint Pipe
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Check the height (A) of the 8 x 53 mm ATF joint pipe (B) between the top (C) of the pipe and solenoid valve body mounting surface (D). The height is about 7 mm (0.3 in.) If the height is over 7 mm (0.3 in.),

push the pipe until it bottoms in the accumulator body.

Fig. 234: Identifying ATF Joint Pipe Height

Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the new gasket (A) on the transmission housing, and install the 8 x 34.5 mm ATF joint pipe (B) with the filter end into the transmission housing and 8 x 25.2 mm ATF pipe (D).

Fig. 235: Identifying ATF Joint Pipe And A/T Clutch Pressure Control Solenoid Valve C With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the new O-rings (E) over the ATF joint pipes.
13. Install A/T clutch pressure control solenoid valve C.

14. Check the connector for rust, dirt, or oil, then connect it securely.
15. Install the battery base bracket and battery base.
16. Install the air cleaner housing and intake air duct.
17. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
18. Do the battery installation procedure (See **INSTALLATION**).

INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT

1. Raise the vehicle up on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the transmission undercover (A) and splash shield (B).

Fig. 236: Identifying Transmission Undercover And Splash Shield With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the damper from the front subframe.

Fig. 237: Identifying Damper With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the input shaft (mainshaft) speed sensor connector, and remove the input shaft (mainshaft) speed sensor (A).

Fig. 238: Identifying Input Shaft (Mainshaft) Speed Sensor And O-Ring With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the new O-ring (B) on the new input shaft (mainshaft) speed sensor, then install the input shaft (mainshaft) speed sensor.
6. Check the connector for rust, dirt, or oil, then connect it securely.
7. Install the damper on the front subframe.
8. Install the splash shield and transmission undercover.

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT

1. Raise the vehicle upon a lift, or apply the parking brake, block both rear wheels, and raise the front of the

vehicle. Make sure it is securely supported.

2. Remove the transmission undercover (A) and splash shield (B).

Fig. 239: Identifying Transmission Undercover And Splash Shield With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the damper from the front subframe.

Fig. 240: Identifying Damper With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the output shaft (countershaft) speed sensor connector, and remove the output shaft (countershaft) speed sensor (A) and sensor washer (B).

Fig. 241: Identifying Output Shaft (Countershaft) Speed Sensor And Sensor Washer With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the new O-ring (C) on the new output shaft (countershaft) speed sensor (B), then install the output shaft (countershaft) speed sensor and sensor washer.
6. Check the connector for rust, dirt, or oil, then connect it securely.
7. Install the damper on the front subframe.
8. Install the splash shield and transmission undercover.

2ND CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT

1. Do the battery removal procedure (See **REMOVAL**).
2. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
3. Remove the intake air duct and air cleaner housing.
4. Remove the battery base and battery base bracket.
5. Disconnect the 2nd clutch transmission fluid pressure switch connector, and remove the switch.

Fig. 242: Identifying 2nd Clutch Transmission Fluid Pressure Switch And Sealing Washer With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the new 2nd clutch transmission fluid pressure switch (A) and a new sealing washer (B), and tighten the switch.
7. Make sure there is no water, oil, dust, or foreign particles inside the connector.
8. Connect the connector securely.
9. Install the battery base bracket and battery base.
10. Install the air cleaner housing and intake air duct.
11. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
12. Do the battery installation procedure (See **INSTALLATION**).

3RD CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT

1. Raise the vehicle up on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the transmission undercover (A) and splash shield (B).

Fig. 243: Identifying Transmission Undercover And Splash Shield With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the damper from the front subframe.

Fig. 244: Identifying Damper With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the 3rd clutch transmission fluid pressure switch connector, and remove the 3rd clutch transmission fluid pressure switch (A), and sealing washer (B).

Fig. 245: Identifying 3rd Clutch Transmission Fluid Pressure Switch And Sealing Washer With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the new 3rd clutch transmission fluid pressure switch and a new sealing washer, and tighten the switch.
6. Make sure there is no water, oil, dust, or foreign particles inside the connector.
7. Connect the connector securely.
8. Install the damper on the front subframe.
9. Install the splash shield and transmission undercover.

4TH CLUTCH TRANSMISSION FLUID PRESSURE SWITCH REPLACEMENT

1. Do the battery removal procedure (See **REMOVAL**).
2. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
3. Remove the intake air duct and air cleaner housing.
4. Remove the battery base and battery base bracket.
5. Disconnect the 4th clutch transmission fluid pressure switch connector, and remove the switch.

Fig. 246: Identifying 4th Clutch Transmission Fluid Pressure Switch And Sealing Washer With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the new 4th clutch transmission fluid pressure switch (A) and a new sealing washer (B), and tighten the switch.
7. Make sure there is no water, oil, dust, or foreign particles inside the connector.
8. Connect the connector securely.
9. Install the battery base bracket and battery base.
10. Install the air cleaner housing and intake air duct.
11. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
12. Do the battery installation procedure (See **INSTALLATION**).

ATF TEMPERATURE SENSOR REPLACEMENT

1. Raise the vehicle up on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the transmission undercover (A) and splash shield (B).

**Fig. 247: Identifying Transmission Undercover And Splash Shield With Torque Specification**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

Fig. 248: Identifying Drain Plug And Sealing Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the drain plug with a new sealing washer (B).
5. Disconnect the ATF temperature sensor connector (A), then remove the connector from the connector bracket (B).

Fig. 249: Identifying ATF Temperature Sensor Connector, ATF Temperature Sensor, Connector Bracket And Harness Clamp With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the harness clamp (C) from its bracket (D).

7. Remove the ATF temperature sensor (E).
8. Install the new O-ring (F) on the new ATF temperature sensor, and install the ATF temperature sensor.
9. Check the connector for rust, dirt, or oil. Connect it securely, and install it on its bracket.
10. Install the harness clamp on its bracket.
11. Refill the transmission with ATF (see step 7 on).
12. Install the splash shield and transmission undercover.

ATF LEVEL CHECK

NOTE: Keep all foreign particles out of the transmission.

1. Park the vehicle on the level ground.
2. Warm up the engine to normal operating temperature (the radiator fan comes on), then turn the engine off. Do not allow the engine to warm up longer than the time it takes for the radiator fan to come on twice.

NOTE: Check the fluid level within 60-90 seconds after turning the engine off. Higher fluid level may be indicated if the radiator fan comes on twice or more.

3. Remove the dipstick (yellow loop) (A) from the dipstick guide tube, and wipe it with a clean cloth.

Fig. 250: Identifying Dipstick (Yellow Loop)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Insert the dipstick into the guide tube.
5. Remove the dipstick and check the fluid level. It should be between the upper mark (A) and lower mark (B).

Fig. 251: Identifying Fluid Level

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the level is below the lower mark, check for fluid leaks at the transmission, and hose and line joints. If a problem is found, fix it before filling the transmission.

NOTE: If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:

- Transmission damage.
- Vehicle does not move in any gear.
- Vehicle accelerates poorly, and flares when starting off in forward and reverse positions.
- The engine vibrates at idle.

7. If the level is above the upper mark, drain the ATF to proper level (see step 5 on).

NOTE: If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.

8. If necessary, fill the transmission with the ATF through the dipstick guide tube opening (A) to bring the fluid level midway between the upper mark and lower mark of the dipstick. Do not fill past the upper mark. Always use Acura ATF-Z1 Automatic Transmission Fluid (ATF). Using a non-Acura ATF can affect shift quality.

Fig. 252: Identifying Dipstick Guide Tube Opening
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Insert the dipstick back into the dipstick guide tube.

ATF REPLACEMENT

NOTE: Keep all foreign particles out of the transmission.

1. Park the vehicle on the level ground.
2. Warm up the engine to normal operating temperature (the radiator fan comes on), and turn the engine off.
3. Raise the vehicle up on a lift, apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
4. Remove the transmission undercover.

Fig. 253: Identifying Transmission Undercover

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the ATF filler bolt and drain plug (A), and drain the automatic transmission fluid (ATF).

NOTE: If a cooler cleaning is done, refer to ATF cooler cleaning (see).

Fig. 254: Identifying Drain Plug And Sealing Washer With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Reinstall the drain plug with a new sealing washer (B).
7. Refill the transmission with the recommended fluid into the filler hole (A). Always use Acura ATF-Z1 Automatic Transmission Fluid (ATF). Using a non-Acura ATF can affect shift quality.

Fig. 255: Identifying ATF Filler Bolt And Sealing Washer With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the ATF filler bolt (B) and a new sealing washer (C).
9. Remove the dipstick (A).

Fig. 256: Identifying Fluid Level

Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Make sure the fluid level is between the upper mark (B) and lower mark (C) on the dipstick.
11. Install the transmission undercover.

Fig. 257: Identifying Transmission Undercover With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. If the maintenance minder required to replace the ATF, reset the maintenance minder (see **RESETTING THE MAINTENANCE INFORMATION DISPLAY**), and this procedure is complete. If the maintenance minder did not require to replace the ATF, go to step 10 and reset the ATF life with the HDS.
13. Connect the HDS to the DLC (A), and go to the BODY ELECTRICAL. If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT**).

TROUBLESHOOTING).

Fig. 258: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Select ADJUSTMENT in the GAUGES MENU with the HDS.
15. Select RESET in the MAINTENANCE MINDER with the HDS.
16. Select MAINTENANCE SUB ITEM 3 RESET, and reset the ATF life with the HDS.

TRANSFER ASSEMBLY FLUID REPLACEMENT

1. Bring the transmission up to normal operating temperature (the radiator fan comes on).
2. Park the vehicle on level ground, and turn the engine off.
3. Raise the vehicle up on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
4. Remove the transmission undercover.

Fig. 259: Identifying Transmission Undercover With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the drain plug (A), and drain the transfer fluid (hypoid gear oil).

Fig. 260: Identifying Drain Plug And Sealing Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Reinstall the drain plug with a new sealing washer (B).
7. Remove the filler plug (A) and sealing washer (B).

Fig. 261: Identifying Filler Plug And Sealing Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Refill the transfer assembly with the recommended fluid (hypoid gear oil) through the filler hole (C) until the fluid flows out. Use an SAE 90 or SAE 80W-90 viscosity hypoid gear oil, API classified GL4 or GL5 only.

Viscosity:

SAE 90: Above 0 °F (-18 °C)

SAE80W-90: Below 0 °F (-18°C)

Transfer Fluid (Hypoid Gear Oil) Capacity:

0.43 L (0.45 US qt) at fluid change

9. Install the filler plug with a new sealing washer.
10. Install the transmission undercover.

TRANSFER ASSEMBLY INSPECTION

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Shift the transmission into N.
3. Make a reference mark (A) across the propeller shaft (B) and the transfer companion flange (C).

Fig. 262: Identifying Reference Mark Across Propeller Shaft And Transfer Companion Flange With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Separate the propeller shaft from the transfer companion flange.
5. Set a dial indicator (A) on the transfer companion flange (B); position dial indicator tip (C) on the direct extension of the bolt hole center (D).

Fig. 263: Identifying Transfer Gear Backlash

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the transfer gear backlash.

Standard: 0.06-0.16 mm (0.002-0.006 in.)

7. If the measurement is out of standard, remove the transfer assembly, and adjust the transfer gear backlash (see **REASSEMBLY**).
8. Check for fluid leaks between the mating faces of the transfer assembly and transmission.
9. If there is leak, remove the transfer assembly, remove the transfer cover, and replace the O-ring.
10. Check for fluid leaks between the transfer companion flange and transfer oil seal.

11. If there is leak, remove the transfer assembly from the transmission, and replace the transfer oil seal and O-ring on the transfer output shaft (hypoid gear). If oil seal and O-ring replacement is required, you will need to check and adjust the transfer gear tooth contact, transfer gear backlash, the tapered roller bearing starting torque, and the total starting torque (see **REASSEMBLY**). Do not replace the oil seal with the transfer assembly on the transmission.

TRANSFER ASSEMBLY REMOVAL

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Shift the transmission into N.
3. Remove the transmission undercover.

Fig. 264: Identifying Transmission Undercover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

Fig. 265: Identifying Drain Plug And Sealing Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reinstall the drain plug with a new sealing washer (B).
6. Remove the front subframe stiffener.

Fig. 266: Identifying Front Subframe Stiffener
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove exhaust pipe A.

Fig. 267: Identifying Exhaust Pipe A
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the bolt securing the transfer breather hose bracket (A), and disconnect the breather hose (B) from the breather pipe (C) on the transfer assembly.

Fig. 268: Identifying Transfer Breather Hose Bracket, Breather Hose And Breather Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Make a reference mark (A) across the propeller shaft (B) and the transfer companion flange (C).

Fig. 269: Identifying Reference Mark Across Propeller Shaft And Transfer Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Separate the propeller shaft from the transfer companion flange.
11. Remove the transfer assembly from the transmission.

Fig. 270: Identifying Transfer Assembly

Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER ASSEMBLY INSTALLATION

1. Clean the areas where the transfer assembly contacts the transmission with solvent, and dry with compressed air. Then apply transmission fluid to the contact area.
2. Install the dowel pin (A) in the transmission, and install the transfer assembly (B) on the transmission.

Fig. 271: Identifying Dowel Pin And Transfer Assembly With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the propeller shaft (A) to the transfer companion flange (B) by aligning the reference mark(C).

Fig. 272: Identifying Reference Mark Across Propeller Shaft And Transfer Companion Flange With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Secure the transfer breather hose bracket (A) on the transfer assembly with the bolt, and install the breather hose (B) over the breather pipe (C) with the dot (D) facing out.

Fig. 273: Identifying Transfer Breather Hose Bracket, Breather Hose And Breather Pipe With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install exhaust pipe A with the new self-locking nuts, its mount (B), and new gaskets (C) (D).

Fig. 274: Identifying Exhaust Pipe Self-Locking Nuts With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the front subframe stiffener with the new mounting bolts.

Fig. 275: Identifying Front Subframe Stiffener Mounting Bolts With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Refill the transfer assembly with transfer fluid (hypoid gear oil), if necessary (see **TRANSFER ASSEMBLY FLUID REPLACEMENT**).
8. Refill the transmission with ATF (see step 7 on).
9. Install the transmission undercover.

Fig. 276: Identifying Transmission Undercover With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER BREATHER HOSE REPLACEMENT

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Remove the transfer breather (A) from its bracket (B).

Fig. 277: Identifying Transfer Breather And Bracket
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the breather hose clamp (A) from the hose clamp (B), and remove the hose clamp (C) from the vacuum hose (D).

Fig. 278: Identifying Breather Hose Clamp, Hose Clamp, Hose Clamp And Vacuum Hose
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the harness clamp (E) on the breather hose from the engine harness (F).
5. Disconnect the breather hose (A) from the transfer breather pipe (B), and remove the breather hose from the hose clamp (C).

Fig. 279: Identifying Breather Hose, Transfer Breather Pipe And Hose Clamp
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

6. Install the breather hose over the breather pipe with the dot (D) facing out, and install the hose on the hose clamp at the dot (E).
7. Install the breather hose clamp on the hose clamp, and install the hose clamp on the vacuum hose at the mark.
8. Install the harness clamp on the engine harness.
9. Install the transfer breather on its bracket.

TRANSMISSION REMOVAL

Special Tools Required

- Engine support hanger, A and Reds AAR-T-12566
- Engine hanger balancer bar VSB02C000019
- Engine hanger adapter set VSB02C000031
- Front subframe adapter EQS02BMDXSB0

These special tools are available through the American Honda Tool and Equipment Program 1-888-424-6857.

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Special tool Reds engine support hanger AAR-T-12566 must be used with the side engine mount installed.**

1. Secure the hood in the wide open position with the support rod.
2. Set the wheels in the straight ahead position, and lock the steering wheel.
3. Drain the power steering system fluid from the reservoir (see **FLUID REPLACEMENT**).
4. Do the battery removal procedure(See **REMOVAL**).
5. Remove the intake manifold cover, intake air duct, and air cleaner housing.
6. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
7. Remove the battery base and battery base bracket.
8. Remove the front bulkhead cover.
9. Raise the vehicle on a lift, and make sure it is securely supported. Remove the front wheels.
10. Remove the transmission undercover and splash shield.

Fig. 280: Identifying Transmission Undercover And Splash Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

Fig. 281: Identifying Drain Plug And Sealing Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Reinstall the drain plug with a new sealing washer (B).
13. Disconnect the steering joint (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
14. Remove the power steering pump outlet line (A) from the power steering pump, and remove the hose clamp bolt (B).

Fig. 282: Identifying Power Steering Pump Outlet Line And Hose Clamp Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Disconnect the transmission breather hose (A) from the breather pipe (B) at the transmission housing.

Fig. 283: Identifying Transmission Breather Hose, Vacuum Hose And Breather Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Disconnect the vacuum hose (C) from the vacuum line (D), and remove the vacuum line bolt.
17. Disconnect the starter cables (A) from the starter, and remove the harness clamp (B) from the clamp bracket (C).

Fig. 284: Identifying Solenoid Harness Connector, Starter Cables, Harness Clamp And Clamp Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Disconnect the solenoid harness connector (D).
19. Remove the dipstick, then remove the starter (A) and gasket (B).

Fig. 285: Identifying Starter And Gasket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the nuts securing the shift cable bracket (A).

Fig. 286: Identifying Shift Cable Bracket, Spring Clip/Washer, Control Pin, Bushing And Control Lever With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
22. Check the bushing (F) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
23. Disconnect A/T clutch pressure control solenoid valve A connector (A), A/T clutch pressure control solenoid valve B connector (B), and 4th clutch transmission fluid pressure switch connector (C), and remove the harness cover mounting bolt (D).

Fig. 287: Identifying A/T Clutch Pressure Control Solenoid Valves Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Disconnect A/T clutch pressure control solenoid valve C connector (A).

Fig. 288: Identifying A/T Clutch Pressure Control Solenoid Valve C Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Remove the bolts securing the harness cover (B).
26. Disconnect the transmission range switch connector (A), and remove the harness clamp (B) from the clamp bracket (C).

Fig. 289: Identifying Transmission Range Switch Connector, Harness Clamp And Clamp Bracket

Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Remove the ATF cooler hoses (A) from the ATF cooler lines (B). Turn the ends of the cooler hoses up to prevent ATF from flowing out, then plug the cooler hoses and lines.

Fig. 290: Identifying ATF Cooler Hoses And ATF Cooler Lines

Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Disconnect the input shaft (mainshaft) speed sensor connector (A), output shaft (countershaft) speed sensor connector (B), ATF temperature sensor connector (C), and 3rd clutch transmission fluid pressure switch connector (D).

Fig. 291: Identifying Input Shaft (Mainshaft) Speed Sensor Connector And ATF Temperature Sensor Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Disconnect the 2nd clutch transmission fluid pressure switch connector (A), and remove the vacuum line bolt (B).

Fig. 292: Identifying 2nd Clutch Transmission Fluid Pressure Switch Connector And Vacuum Line Bolt

Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Remove the bolt securing the engine mount control solenoid valve mounting bracket.

Fig. 293: Identifying Engine Mount Control Solenoid Valve Mounting Bracket

Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Remove the connector bracket from the engine front cylinder head; use the bracket bolt hole to attach engine hanger balancer bar front arm.

Fig. 294: Identifying Connector Bracket

Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Remove the transfer breather bracket from the engine rear cylinder head; use the bracket bolt hole to attach engine hanger balancer bar rear arm.

Fig. 295: Identifying Transfer Breather Bracket

Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Remove the service caps (A) for the front damper flange nuts from the cowl cover (B). Position the engine hanger adapters (VSB02C000031) over the damper flange nuts.

Fig. 296: Identifying Service Caps And Cowl Cover
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Install the engine balance bar (VSB02C000019); attach the front arm (A) to the front cylinder head with a spacer and the 10 mm bolt, and attach the rear arm (B) to the rear cylinder head with the 8 mm bolt.

Fig. 297: Identifying Engine Balance Bar
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Install the engine support hanger (AAR-T-12566) to the vehicle, and attach the hook to the slotted hole in the engine balance bar. Tighten the wing nut (C) by hand, to lift and support the engine.
36. Remove the front mount stop (A) and front mount bolt (B).

Fig. 298: Identifying Front Mount Stop And Front Mount Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Remove the front subframe stiffener.

Fig. 299: Identifying Front Subframe Stiffener
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Remove exhaust pipe A and its mount (B).

Fig. 300: Identifying Exhaust Pipe

Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Disconnect the headlight adjuster leveling sensor connector (A) on both lower arms, and remove the harness clamps (B) from the front subframe for models equipped with the headlight adjuster leveling system.

Fig. 301: Identifying Headlight Adjuster Leveling Sensor Connector And Harness Clamps

Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Remove the lock pins (A) and castle nuts (B), and separate the lower arms (C) from the knuckles (D) (see step 5 on **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).

Fig. 302: Identifying Lock Pins, Castle Nuts, Tie-Rod End Ball Joints And Stabilizer Link
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Insert a 6 mm Allen wrench (E) in the top of the ball joint pin (F), and remove the nuts (G), then separate the stabilizer link (H).
42. Remove the cotter pins (I) and nuts (J), and separate the tie-rod end ball joints (K) from the knuckles (see step 3 on **KNUCKLE/HUB BEARING UNIT REPLACEMENT**).
43. Remove the bolt securing the transfer breather hose bracket (A), and disconnect the breather hose (B) from the breather pipe (C) on the transfer assembly.

Fig. 303: Identifying Transfer Breather Hose Bracket, Breather Hose And Breather Pipe
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Make a reference mark (A) across the propeller shaft (B) and the transfer companion flange (C), and separate the propeller shaft from the transfer companion flange.

Fig. 304: Identifying Reference Mark Across Propeller Shaft And Transfer Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Remove the transfer assembly from the transmission.

Fig. 305: Identifying Transfer Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Remove the torque converter cover (A), and remove the drive plate bolts (B) (8) while rotating the crankshaft pulley.

Fig. 306: Identifying Torque Converter Cover And Drive Plate Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Disconnect the power steering pressure switch connector.

Fig. 307: Identifying Power Steering Pressure Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Loosen the hose clamp bolt, then disconnect the power steering fluid hose from the fluid line at the left front of the subframe.

Fig. 308: Identifying Power Steering Fluid Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Remove the transmission lower mount bolt.

Fig. 309: Identifying Transmission Lower Mount Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Remove the four rear mount bracket bolts.

Fig. 310: Identifying Rear Mount Bracket Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Remove the bolt securing the power steering fluid line clamp bracket (A) on the rear mount bracket, and turn the bracket away from the rear mount bracket.

Fig. 311: Identifying Power Steering Fluid Line Clamp Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Loosen the four bolts (A) holding the adjustable arms (B) of the front subframe adapter (EQS02BMDXSB0) to its center plate.

NOTE: The adapter is designed to be used with a commercially available transmission jack.

Fig. 312: Identifying Front Subframe Adapter Adjustable Arms Bolts
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Line up the slots in the arms with the bolt holes on the corner of the jack base, then attach the adapter (EQS02BMDXB0) to the jack base with the bolts (A) that came with the jack. Tighten the bolts securely.

Fig. 313: Identifying Subframe Stiffener Mounting Bolts With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

54. Raise the jack to the vehicle height, then attach the adapter to the front subframe using the subframe stiffener mounting bolts (B) and bolt holes.
55. Remove the six bolts securing the front stiffeners (A) and rear stiffeners (B), and four bolts securing the front subframe (C), and lower the front subframe.

Fig. 314: Identifying Front And Rear Stiffeners Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Remove the transmission lower mount (A).

Fig. 315: Identifying Transmission Lower Mount And Transmission Ground Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Remove the transmission ground terminal (B).
58. Remove the driveshafts from the differential and the intermediate shaft. Coat all precision machined surfaces with clean engine oil, then put plastic bags over driveshaft ends.

Fig. 316: Identifying Driveshaft Ends With Plastic Bags
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Remove the exhaust manifold bracket (A) and heat shield (B).

Fig. 317: Identifying Intermediate Shaft, Exhaust Manifold Bracket And Heat Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

60. Remove the intermediate shaft (C). Coat all precision machined surfaces with clean engine oil, then put plastic bags over intermediate shaft ends.
61. Remove the upper transmission housing mounting bolts.

Fig. 318: Identifying Upper Transmission Housing Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

62. Remove the lower transmission housing mounting bolts.

Fig. 319: Identifying Lower Transmission Housing Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

63. Remove the harness clamp bracket (A) from the front mount bracket (B), and remove the mount bracket.

Fig. 320: Identifying Harness Clamp Bracket And Transmission Housing Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

64. Remove the transmission housing mounting bolt (C) using a socket 22 mm in length.
65. Remove the rear transmission housing mounting bolts.

Fig. 321: Identifying Rear Transmission Housing Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

66. Place a jack under the transmission.
67. Lower the transmission by loosening the wing nut of the engine support hanger, and tilt the engine just enough for the transmission to clear its end from the side frame.
68. Slide the transmission away from the engine to remove it from the vehicle.
69. Remove the torque converter and dowel pins.

Fig. 322: Identifying Torque Converter And Dowel Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

70. Remove the drive plate (A) and washer (B) from the engine crankshaft, and replace the drive plate whenever the transmission is removed from the engine.

Fig. 323: Identifying Drive Plate And Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION INSTALLATION

Special Tools Required

- Engine support hanger, A and Reds AAR-T-12566
- Engine hanger balancer bar VSB02C000019
- Engine hanger adapter set VSB02C000031
- Front subframe adapter EQS02BMDXSB0

These special tools are available through the American Honda Tool and Equipment Program 1-888-424-

6857.

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Clean the ATF cooler (see **ATF COOLER CLEANING**).
2. Install the new drive plate (A) and washer (B) on the engine crankshaft, and tighten the eight bolts in a crisscross pattern in two or more steps.

Fig. 324: Identifying Drive Plate And Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the torque converter (A) on the mainshaft (B) with the new O-ring (C).

Fig. 325: Identifying Dowel Pin, Torque Converter And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 14 mm dowel pin (D) and 10 mm dowel pin (E) in the torque converter housing.

5. Place the transmission on the jack, and raise it to engine level.
6. Attach the transmission to the engine, and install the lower transmission housing mounting bolts.

Fig. 326: Identifying Lower Transmission Housing Mounting Bolts With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the rear transmission housing mounting bolts.

Fig. 327: Identifying Rear Transmission Housing Mounting Bolts With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the upper transmission housing mounting bolts.

Fig. 328: Identifying Upper Transmission Housing Mounting Bolts With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the transmission housing mounting bolt (A).

Fig. 329: Identifying Transmission Housing Mounting Bolt And Harness Clamp Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the front mount bracket (B) with the new mounting bolts.

11. Secure the harness clamp bracket (C) with the bolt.
12. Install the new set ring (A) on the intermediate shaft (B).

Fig. 330: Identifying Set Ring, Intermediate Shaft, Exhaust Manifold Bracket And Heat Shield With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Clean the areas where the intermediate shaft contacts the transmission (differential) with solvent, and dry with compressed air. Apply ATF to intermediate shaft splines (C), then install the intermediate shaft, be sure not to allow dust or other foreign particles to enter the transmission.
14. Install the exhaust manifold bracket (D) and heat shield (E).
15. Install the new set ring (A) on the left driveshaft (B).

Fig. 331: Identifying Set Ring And Left Driveshaft
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Clean the areas where the left driveshaft contacts the transmission (differential) with solvent, and dry with compressed air. Then install the left driveshaft, be sure not to allow dust or other foreign particles to enter the transmission. Turn the steering knuckle fully outward, and slide the driveshaft into the differential until you feel its set ring fully engage the side gear.
17. Apply the recommended grease to the right driveshaft inboard-joint splines.
18. Slide the right driveshaft over the intermediate shaft splines until you feel the driveshaft fully engage the intermediate shaft set ring.
19. Install the transmission lower mount (A).

Fig. 332: Identifying Transmission Lower Mount And Transmission Ground Cable With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the transmission ground cable (B).
21. Support the front subframe (A) with the front subframe adapter (EQS02BMDXB0) and a jack, and lift it

up to the body.

Fig. 333: Identifying Front Subframe With Front Subframe Adapter And Jack
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Loosely install the new subframe mounting bolts: front (A), rear (B), rear stiffeners (C) and mounting bolts (D), and front stiffeners (E) and mounting bolts (F).

Fig. 334: Identifying Subframe Mounting Bolts And Stiffeners With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Align all reference marks (A) on the front subframe (B) with the body (C), then tighten the bolts on the front subframe to the specified torque.

Fig. 335: Identifying Reference Marks On Front Subframe With Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Loosely tighten the left rear subframe mounting bolt in the same manner in step 23.
25. Loosely tighten the right and left front subframe mounting bolts.
26. Loosen the right rear mounting bolt, then tighten the bolt to the specified torque.
27. Tighten the left rear mounting bolt to the specified torque.
28. Tighten the right and left front mounting bolts to the specified torque.
29. Check that the positioning holes and slot are aligned using the frame positioning guide pin.
30. Tighten the rear and front stiffener mounting bolts to the specified torque.
31. Remove the jack and front subframe adapter.
32. Install the two mount bracket bolts (A) on the rear of the bracket, and install the new bolts (B) on the front.

Fig. 336: Identifying Mount Bracket Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Install the new transmission lower mount bolt.

Fig. 337: Identifying Transmission Lower Mount Bolt With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Attach the torque converter to the drive plate (A) with eight bolts (B). Rotate the crankshaft pulley as necessary to tighten the bolt to 1/2 of the specified torque, then to the final torque, in a crisscross pattern. After tightening the last bolt, check that the crankshaft rotates freely.

Fig. 338: Identifying Torque Converter Bolts With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Install the torque converter cover (C).
36. Connect the power steering fluid hose (A) to the line (B), and secure the hose with its hose clamp (C).

Fig. 339: Identifying Power Steering Fluid Hose And Hose Clamp
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Turn the power steering fluid line clamp bracket (A) to seat on the rear mount bracket (B), and secure the bracket on the rear mount bracket.

Fig. 340: Identifying Power Steering Fluid Line Clamp Bracket With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Connect the power steering pressure switch connector.

Fig. 341: Identifying Power Steering Pressure Switch Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Install the dowel pin (A) in the transmission, and install the transfer assembly (B) on the transmission.

Fig. 342: Identifying Dowel Pin And Transfer Assembly With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Secure the transfer breather hose bracket (A) on the transfer assembly with the bolt, and install the breather hose (B) over the breather pipe (C) with the dot (D) facing out.

Fig. 343: Identifying Transfer Breather Hose Bracket, Breather Hose And Breather Pipe With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Install the propeller shaft (A) to the transfer companion flange (B) by aligning the reference mark (C).

Fig. 344: Identifying Reference Mark On Propeller Shaft And Transfer Companion Flange With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the ball joints on each lower arm (A) to each knuckle (B) with new castle nuts (C), and secure the castle nuts with the lock pins (D).

Fig. 345: Identifying Tie-Rod End Ball Joints, Stabilizer Link, Knuckle, Castle Nuts And Lock Pins With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Install the nuts (E) to the ball joint pins (F) on each stabilizer link (G). Insert a 6 mm Allen wrench (H) in the top of the ball joint pins, and tighten the nuts to the specified torque.
44. Install the tie-rod end ball joints (I) to each knuckle with the nuts (J) and new cotter pins (K).

45. Connect the headlight adjuster leveling sensor connector (A) on both lower arms, and install the harness clamps (B) on the front subframe for model equipped with the headlight adjuster leveling system.

Fig. 346: Identifying Headlight Adjuster Leveling Sensor Connector And Harness Clamps
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Install exhaust pipe A with the new self-locking nuts, its mount (B), and new gaskets (C) (D).

Fig. 347: Identifying Exhaust Pipe And Gaskets With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Install the front subframe stiffener with the new mounting bolts.

Fig. 348: Identifying Front Subframe Stiffener Mounting Bolts With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Install the new front mount bolt, and install the front mount stop (A) with new nuts and vacuum hose clamp (B).

Fig. 349: Identifying Front Mount Stop And Vacuum Hose Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Remove the engine support hanger, engine support hanger stands, and engine balancer bar.
50. Install the connector bracket on the engine front cylinder head.

Fig. 350: Identifying Connector Bracket On Engine Front Cylinder Head With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Install the transfer breather bracket on the engine rear cylinder head, and connect the breather hose over the breather pipe.

Fig. 351: Identifying Transfer Breather Bracket With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Securing the engine mount control solenoid valve mounting bracket (A) with the bolt.

Fig. 352: Identifying Engine Mount Control Solenoid Valve Mounting Bracket With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Connect the 2nd clutch transmission fluid pressure switch connector (A), and secure the vacuum line (B) with the bolt.

Fig. 353: Identifying 2nd Clutch Transmission Fluid Pressure Switch Connector And Vacuum Line With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

54. Connect the input shaft (mainshaft) speed sensor connector (A), output shaft (countershaft) speed sensor connector (B), ATF temperature sensor connector (C), and 3rd clutch transmission fluid pressure switch connector (D). Do not allow water, fluid, oil, dust, or other foreign particles to enter any of the connectors.

Fig. 354: Identifying Input Shaft (Mainshaft) Speed Sensor Connector And ATF Temperature Sensor Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Connect the ATF cooler hoses (A) to the ATF cooler lines (B), and secure the hoses with the clips (C) (see **ATF COOLER HOSE REPLACEMENT**).

Fig. 355: Identifying ATF Cooler Hoses, ATF Cooler Lines And Hose Clips

Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Connect the transmission range switch connector (A), and install the harness clamp (B) on the clamp bracket (C).

Fig. 356: Identifying Transmission Range Switch Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Secure the harness cover (A) with the bolts.

Fig. 357: Identifying Harness Cover Bolts With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

58. Connect the A/T clutch pressure control solenoid valve C connector.
59. Secure the harness cover (A) with the bolt.

Fig. 358: Identifying Harness Cover Bolt And A/T Clutch Pressure Control Solenoid Valves Connectors With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

60. Connect A/T clutch pressure control solenoid valve A connector (B), A/T clutch pressure control solenoid valve B connector (C), and 4th clutch transmission pressure switch connector (D).
61. Apply molybdenum grease to the hole in the bushing (A) in the shift cable end (B). Attach the shift cable end to the control lever (C), then insert the control pin (D) into the control lever hole through the shift cable end, and secure the control pin with the spring clip/washer (E).

Fig. 359: Identifying Control Pin, Bushing, Control Lever, Spring Clip/Washer And Shift Cable Bracket With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

62. Secure the shift cable bracket (F) with the nuts.
63. Install the starter (A) and new gasket (B) (see STARTER REMOVAL AND INSTALLATION).

Fig. 360: Identifying Starter And Gasket With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

64. Install the starter cables (A), and install the harness clamp (B) on the clamp bracket (C).

Fig. 361: Identifying Starter Cables, Harness Clamp And Clamp Bracket With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

65. Connect the solenoid harness connector (D).

66. Install the transmission breather hose (A) over the breather pipe (B) with the dot (C) facing up.

Fig. 362: Identifying Transmission Breather Hose And Breather Pipe With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

67. Secure the vacuum line (D) with the bolt, and connect the vacuum hose (E) to the line.
68. Install the power steering pump outlet line (A) with the new O-ring (B) to the pump, and secure the hose clamp (C) with the bolt.

Fig. 363: Identifying Power Steering Pump Outlet Line, O-Ring And Hose Clamp With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

69. Connect the steering joint (see **INSTALLATION**).
70. Refill the power steering fluid reservoir with fluid to the upper level line.

71. Refill the transmission with ATF (see step 7 on).
72. Install the battery base bracket and battery base.
73. Install the air cleaner housing, intake air duct, and intake manifold cover.
74. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
75. Do the battery installation procedure (See **INSTALLATION**).
76. Install the bulkhead cover.
77. Install the splash shield (A) and transmission undercover (B).

Fig. 364: Identifying Splash Shield And Transmission Undercover With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

78. Install the service caps on the cowl cover.
79. Install the front wheels.
80. Set the parking brake, run the engine at fast idle, and turn the steering wheel from lock-to-lock several times to bleed air from the system. Recheck the fluid level, and refill if necessary.
81. Set the parking brake. Start the engine, and shift the transmission through all positions three times. Check the shift lever operation, A/T gear position indicator operation, and shift cable adjustment.
82. Check and adjust the front wheel alignment (see **WHEEL ALIGNMENT**).
83. Check the ATF level (see **ATF LEVEL CHECK**).
84. Road-test vehicle (see **ROAD TEST**).

ATF COOLER CLEANING

Special Tools Required

- ATF cooler cleaner GHTTTCF6H
- Magnetic nonbypass spin-on filter GTHGNBP2

These special tools are available through the American Honda Tool and Equipment Program 1-888-424-6857.

Before installing an overhauled or remanufactured automatic transmission, you must thoroughly clean the ATF cooler to prevent system contamination. Failure to do so could cause a repeat automatic transmission failure.

The cleaning procedure involves heated ATF-Z1 delivered under high pressure (100 psi). Check the security of all hoses and connections. Always wear safety glasses or a face shield, along with gloves and protective clothing. If you get ATF in your eyes or on your skin, rinse with water immediately.

WARNING:

- Improper use of the ATF cooler cleaner can result in burns and other serious injuries.
- Always wear eye protection and protective clothing, and follow all instructions in this manual.

1. Check the fluid in the cooler cleaner tank. (The fluid level should be 4.5 inches from the top of the filler neck.) Adjust the level if needed; do not overfill. Use only Acura ATF-Z1; do not use any additives.

Fig. 365: Identifying Fluid In Cooler Cleaner Tank
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Plug the cooler cleaner into a 110 V grounded electrical outlet.

NOTE:

Make sure the outlet has no other appliances (light fixtures, drop lights, extension cords) plugged into it. Also, never plug the cooler cleaner into an extension cord or drop light; you could damage the unit.

Fig. 366: Identifying Air Purge Valve, Red Hose And Blue Hose
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Flip the HEAT toggle switch to ON; the green indicator above the toggle switch comes on. Wait 1 hour for the cooler cleaner to reach its operating temperature. (The cooler cleaner is ready to use when the temperature gauge reads 140° to 150°F.)

NOTE: If the red indicator above the HEAT toggle switch comes on, the fluid level in the tank is too low for the tank heater to work (see step 1 of this procedure).

4. Select the appropriate pair of fittings, and attach them to the radiator, to the hoses, or to the banjo bolts for flow through the ATF cooler cleaner.

Fig. 367: Identifying Fittings, Hose And Banjo Bolt
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the red hose to the cooler outlet line (the line that normally goes to the external filter on the transmission).
6. Connect the blue hose to the cooler inlet line.
7. Connect a shop air hose (regulated to 100 to 125 psi) to the air purge valve.

NOTE: The quick-connect fitting has a one-way check valve to keep ATF from entering your shop's air system. Do not remove or replace the fitting. Attach the coupler provided with the cooler cleaner to your shop air line if your coupler is not compatible.

8. Flip the MOTOR toggle switch to ON; the green indicator above the toggle switch comes on. Let the pump run for 5 minutes. While the pump is running, open and close the air purge valve periodically to cause agitation and improve the cleaning process. Always open the valve slowly. At the end of the 5-minute cleaning period, leave the air purge valve open.

NOTE: While the pump is running with the air purge valve open, it is normal to see vapor coming from the filler/breather tube vents.

Fig. 368: Identifying Air Purge Valve

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. With the air purge valve open, flip the MOTOR toggle switch to OFF; the green indicator goes off. Leave the air purge valve open for at least 15 seconds to purge the lines and hoses of residual ATF, then close the valve.
10. Disconnect the red and blue hoses from the ATF cooler. Now connect the red hose to the cooler inlet line.
11. Now connect the blue hose to the cooler outlet line.
12. Flip the MOTOR toggle switch to ON, and let the pump run for 5 minutes. While the pump is running, open and close the air purge valve periodically. Always open the valve slowly. At the end of the 5-minute cleaning period, leave the air purge valve open.

NOTE: While the pump is running with the air purge valve open, it is normal to see vapor coming from the filler/breather tube vents.

13. With the air purge valve open, flip the MOTOR toggle switch to OFF. Leave the air purge valve open for at least 15 seconds to purge the lines and hoses of residual ATF, then close the valve.
14. Disconnect the red and blue hoses from the ATF cooler lines.
15. Connect the red and blue hoses to each other.
16. Disconnect the shop air from the air purge valve. Disconnect and stow the coupler if used.

17. Disconnect and stow the fittings from the ATF cooler inlet and outlet lines.
18. Unplug the cooler cleaner from the 110 V outlet.

Tool Maintenance

Follow these instructions to keep the ATF cooler cleaner working properly:

- Replace the two magnetic nonbypass spin-on filters once a year or when you notice a restriction in the ATF flow.
- Check the level and condition of the fluid in the tank before each use.
- Replace the ATF in the tank when it looks dark or dirty.

Fig. 369: Identifying Filler Cap, Heater, Tank And Magnetic Nonbypass Spin-On Filter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ATF COOLER HOSE REPLACEMENT

1. Slide the ATF cooler hoses (A) over the ATF cooler lines (B) until the hose ends contact with the bulge (C) of the ATF cooler line, and secure the hoses with the clips (D) at 2-4 mm (0.1-0.2 in.) (E) from the hose end.

Fig. 370: Identifying ATF Cooler Hoses, ATF Cooler Lines And Hoses Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Slide the ATF cooler outlet hose (F) over the ATF cooler outlet line (G) at the transmission until the hose end contacts with the bulge (H) of the ATF cooler line. Secure the hose with the clip (I) facing tab (J) up at 6-8 mm (0.2-0.3 in.) (K) from the hose end.
3. Slide the ATF cooler hoses (L) over the ATF cooler lines (M) until the hose ends contact with the bulge (N) of the ATF cooler line, and secure the hoses with the clips (O) at 6-8 mm (0.2-0.3 in.) (P) from the hose end.

ATF COOLER REPLACEMENT

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Remove the transmission undercover (A) and splash shield (B).

Fig. 371: Identifying Transmission Undercover And Splash Shield With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the front bulkhead cover, and remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
4. Remove the hose clamp (A), and remove the ATF cooler inlet hose (B) and outlet hose (C) from the hose clamps (D), then disconnect the hoses from the ATF cooler lines.

Fig. 372: Identifying ATF Cooler Inlet Hose, Outlet Hose And Hose Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the power steering fluid hose clamp (A) from the ATF cooler mounting bracket.

Fig. 373: Identifying Power Steering Fluid Hose Clamp And ATF Cooler With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the ATF cooler (B), and replace it. Install the new ATF cooler.
7. Install the power steering fluid hose clamp on the bracket.
8. Slide the ATF cooler inlet hose over the ATF cooler line until the hose end contacts with the bulge, and secure the hose with the clip at 6-8 mm (0.2-0.3 in.) from the hose end.
9. Slide the ATF cooler outlet hose over the ATF cooler line until the hose end contacts with the bulge, and secure the hose with the clip at 2-4 mm (0.1-0.2 in.) from the hose end.
10. Secure the cooler hoses with the hose clamps at the marks on the hoses.
11. Install the hose clamp at the mark.
12. Install the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**), and install the front bulkhead cover.
13. Install the splash shield and transmission undercover.
14. Check the ATF level (see **ATF LEVEL CHECK**).

SHIFT LEVER REMOVAL

1. Remove passenger's center console trim (see step 6 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Remove the beverage holder inner case (see step 10 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
3. Shift the transmission into R.
4. Remove the nut securing the shift cable end.

Fig. 374: Identifying Shift Cable End Nut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Press the holder lock release (A), and pull out the socket holder (B) to remove the shift cable (C) from the shift lever bracket base (D). Do not remove the shift cable by pulling the shift cable guide (E) and damper (F).

Fig. 375: Identifying Pulling Out Socket Holder

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the center console (see [CENTER CONSOLE REMOVAL/INSTALLATION](#)).
7. Disassemble the center console by removing the following:
 - Console armrest (see [CONSOLE ARMREST REMOVAL/INSTALLATION](#))
 - Center console latch panel (see [CENTER CONSOLE LATCH PANEL REMOVAL/INSTALLATION](#))
 - Center console panel (see [CENTER CONSOLE LATCH PANEL REMOVAL/INSTALLATION](#))
 - Center console beverage holder (see [CENTER CONSOLE BEVERAGE HOLDER REPLACEMENT](#))
 - Center console box (see [CENTER CONSOLE BOX REPLACEMENT](#))

8. Remove the shift lever assembly from the console frame.

Fig. 376: Identifying Shift Lever Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LEVER INSTALLATION

1. Install the shift lever assembly on the console frame.

Fig. 377: Identifying Shift Lever Assembly With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Assemble the center console by installing the following:
 - Center console box (see **CENTER CONSOLE BOX REPLACEMENT**)
 - Center console beverage holder (see **CENTER CONSOLE BEVERAGE HOLDER REPLACEMENT**)
 - Center console panel (see **CENTER CONSOLE LATCH PANEL REMOVAL/INSTALLATION**)
 - Center console latch panel (see **CENTER CONSOLE LATCH PANEL REMOVAL/INSTALLATION**)
 - Console armrest (see **CONSOLE ARMREST REMOVAL/INSTALLATION**)
3. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
4. Install the shift cable on the shift lever, and adjust the shift cable (see step 6 on).
5. Install the beverage holder inner case (see step 10 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
6. Install the passenger's center console trim (see step 6 of **CENTER CONSOLE REMOVAL/INSTALLATION**).

SHIFT LEVER KNOB REPLACEMENT

1. Grasp the shift lever boot ring, and slip it out of the shift lever knob cover.

Fig. 378: Identifying Shift Lever Boot Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the screws (A), and remove the shift lever knob (B).

Fig. 379: Identifying Shift Lever Knob Screws With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Apply non-hardening thread lock sealant to the screw threads.
4. Install the new shift lever knob, and secure it with the screws.
5. Slide the shift lever boot ring over the shift lever knob until it snaps on.

SHIFT LEVER DISASSEMBLY/REASSEMBLY

Apply silicon grease to movable joints of the shift lock mechanism and shift lever.

Fig. 380: Exploded View Of Shift Lever Assembly With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LEVER BRACKET BASE REPLACEMENT

NOTE: Refer to the SHIFT LEVER DISASSEMBLY/REASSEMBLY (see) during the following procedures.

1. Remove the shift lever (see SHIFT LEVER REMOVAL).
2. Grasp the shift lever boot ring, and slip it out of the shift lever knob cover.

Fig. 381: Identifying Shift Lever Boot Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws (A), and remove the shift lever knob(B).

Fig. 382: Identifying Shift Lever Knob Screws With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the A/T gear position indicator panel light socket from the indicator panel, and remove the indicator panel from the shift lever bracket base.
5. Remove the shift lock release.
6. Remove the shift lock solenoid and harness connector.
7. Remove the shift lock stop and stop cushion as an assembly.
8. Replace the shift lever bracket base.
9. Apply silicone grease to mounting pin of the shift lock stop, and install the shift lock stop and stop

cushion over the pin.

10. Apply silicone grease to joint of the shift lock solenoid plunger and shift lock stop.
11. Install the shift lock solenoid plunger and plunger spring in the shift lock solenoid.
12. Install the shift lock solenoid by aligning the joint of the shift lock solenoid plunger with the tip of the shift lock stop, then push the shift lock solenoid into the shift lever securely.
13. Install the shift lock release.
14. Install the A/T gear position indicator panel light bulb in its socket.
15. Install the A/T gear position indicator panel on the shift lever bracket base, and install the indicator panel light socket in the indicator panel.
16. Apply non-hardening thread lock sealant to the screw threads, install the shift lever knob, and secure it with the screws.
17. Slide the shift lever boot ring over the shift lever knob until it snaps on.
18. Install the shift lever (see **SHIFT LEVER INSTALLATION**).

SHIFT LEVER BOOT AND A/T GEAR POSITION INDICATOR PANEL REPLACEMENT

1. Remove the shift lever (see **SHIFT LEVER REMOVAL**).
2. Grasp the shift lever boot ring, and slip it out of the shift lever knob cover.

Fig. 383: Identifying Shift Lever Boot Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws (A), and remove the shift lever knob(B).

Fig. 384: Identifying Shift Lever Knob Screws With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the A/T gear position indicator panel light socket from the indicator panel, and remove the indicator panel from the shift lever bracket base.
5. Release the lock tabs retaining the shift lever boot using a screwdriver.

Fig. 385: Identifying Lock Tabs Retaining Shift Lever Boot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Replace the shift lever boot or A/T gear position indicator panel, and install the boot in the indicator panel.

Fig. 386: Identifying Shift Lever Boot

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the A/T gear position indicator panel on the shift lever bracket base, and install the indicator panel light socket in the indicator panel.
8. Apply non-hardening thread lock sealant to the screw threads, install the shift lever knob, and secure it with the screws.
9. Slide the shift lever boot ring over the shift lever knob until it snaps on.
10. Install the shift lever (see **SHIFT LEVER INSTALLATION**).

SHIFT CABLE REPLACEMENT

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Remove passenger's center console trim (see step 6 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
3. Remove the beverage holder inner case (see step 10 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
4. Shift the transmission into R.
5. Remove the nut securing the shift cable end.

Fig. 387: Identifying Shift Cable End Nut**Courtesy of AMERICAN HONDA MOTOR CO., INC.**

6. Press the holder lock release (A), and pull out the socket holder (B) to remove the shift cable (C) from the shift lever bracket base (D).

**Fig. 388: Identifying Out Socket Holder****Courtesy of AMERICAN HONDA MOTOR CO., INC.**

7. Do the battery removal procedure (See **REMOVAL**).
8. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
9. Remove the intake air duct and air cleaner housing.
10. Remove the battery base and battery base bracket.
11. Remove the nuts securing the shift cable bracket (A).

Fig. 389: Identifying Shift Cable Bracket, Spring Clip/Washer, Control Pin And Control Lever With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
13. Remove the heat shield under the shift cable grommet.
14. Remove the drain hose clamp (A) from the shift cable bracket (B).

Fig. 390: Identifying Drain Hose Clamp, Shift Cable Grommet And Shift Cable Bracket With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the nuts securing the shift cable bracket.
16. Remove the shift cable grommet (C), and pull out the shift cable (D).
17. Insert the new shift cable through the grommet hole (E), and install the grommet in its hole. Do not bend the shift cable excessively.
18. Install the shift cable bracket, and install the drain hose clamp on the bracket.
19. Install the heat shield.
20. Apply molybdenum grease to the hole in the bushing in the shift cable end. Attach the shift cable end to the control lever, then insert the control pin into the control lever hole through the shift cable end, and secure the control pin with the spring clip/ washer.
21. Secure the shift cable bracket with the nuts.
22. Install the battery base bracket and battery base.
23. Install the air cleaner housing and intake air duct.
24. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
25. Do the battery installation procedure (See **INSTALLATION**).
26. Install the shift cable on the shift cable, and adjust the shift cable (see step 6 on).

SHIFT CABLE ADJUSTMENT

1. Remove passenger's center console trim (see step 6 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Remove the beverage holder inner case (see step 10 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
3. Shift the transmission into R.
4. Remove the nut securing the shift cable end.

Fig. 391: Identifying Shift Cable End Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Press the holder lock release (A), and pull out the socket holder (B) to remove the shift cable (C) from the shift lever bracket base (D). Do not remove the shift cable by pulling the shift cable guide (E) and damper (F).

Fig. 392: Identifying Pulling Out Socket Holder

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Push the shift cable (A) until it stops, then release it. Pull the shift cable back one step so that the shift position is in R. Do not hold the shift cable guide (B) and damper (C) to adjust the shift cable.

Fig. 393: Identifying Shift Cable

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Turn the ignition switch to ON (II), and check that the R indicator light comes on.
8. Turn the ignition switch to LOCK (0).
9. Place the shift lever in R, then insert a tapered tip 6.0 mm (0.24 in.) pin (A) through the positioning hole (B) on the shift lever bracket base, through the positioning hole (C) on the shift lever, and into the positioning small hole (D) on the shift lever bracket base. The shift lever is secured in R.

Fig. 394: Identifying Positioning Hole On Shift Lever And Shift Lever Bracket Base
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Align the socket holder (A) on the shift cable (B) with the slot in the bracket base (C), then slide the holder into the base. Install the shift cable end (D) over the mounting stud (E) by aligning its square hole (F) with the square fitting (G) at the bottom of the stud. Push the holder until it snaps securely in place. Do not install the shift cable by holding the shift cable guide (H) and damper (I).

Fig. 395: Identifying Socket Holder Into Bracket Base
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check that the shift cable end (A) is properly installed on the mounting stud (B).

Properly Installed:

Improperly Installed:

Cable end rides on the bottom of the mounting stud.

Fig. 396: Identifying Proper Installation Position Of Shift Cable End
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. If improperly installed, remove the shift cable from the bracket base, and reinstall the shift cable. Do not install the shift cable end on the mounting stud while the shift cable is on the bracket base.
13. Install and tighten the nut.

8 x 1.25 mm
22 N·m (2.2 kgf·m, 16 lbf·ft)

Fig. 397: Identifying Shift Cable End Nut With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the 6.0 mm (0.24 in.) pin that was installed to hold the shift lever.
15. Turn the ignition switch to ON (II). Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
16. Shift to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases, and also check that the shift lever locks when it is shifted back to P.
17. Install the beverage holder inner case (see step 10 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
18. Install the passenger's center console trim (see step 6 of **CENTER CONSOLE REMOVAL/INSTALLATION**).

A/T GEAR POSITION INDICATOR

COMPONENT LOCATION INDEX

CIRCUIT DIAGRAM

Fig. 399: A/T Gear Position Indicator Circuit Diagram
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION RANGE SWITCH TEST

1. Do the battery removal procedure (See **REMOVAL**).
2. Remove the battery hold-down bracket, and remove the battery cover, battery, and battery tray.

3. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
4. Remove the intake air duct and air cleaner housing.
5. Remove the battery base and battery base bracket.
6. Disconnect the transmission range switch connector.

Fig. 400: Identifying Transmission Range Switch Connector Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Check for continuity between terminals at the transmission range switch connector. There should be continuity between the terminals in the following table for each transmission range switch position.

Transmission Range Switch Connector

Transmission Range Switch Connector										
Position/Connector Terminal/Signal Connections										
	1	2	3	4	5	6	7	8	9	10
	-	D	R	P	GND	ATP FWD	D3	N	ATP RVS	ATP NP
P				○	○	—			○	○
R			○	—	○				○	
N					○	—		○	○	○
D		○	—		○	○				
D3					○	○	○			

Fig. 401: Checking For Continuity Between Terminals In Each Switch Position
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. The transmission range switch test is finished if the test results are OK. Reinstall all removed components.

If there is no continuity between any terminals, check the transmission range switch installation. If the switch installation is OK, replace the switch (see **TRANSMISSION RANGE SWITCH**

REPLACEMENT).

9. Install the under-hood subfuse box from its bracket, and install the bracket from the battery base.
10. Do the battery installation procedure (See **INSTALLATION**

TRANSMISSION RANGE SWITCH REPLACEMENT

1. Do the battery removal procedure (See **REMOVAL** .
2. Remove the under-hood subfuse box from its bracket, and remove the bracket from the battery base.
3. Remove the intake air duct and air cleaner housing.
4. Remove the battery base and battery base bracket.
5. Remove the nuts securing the shift cable bracket (A).

Fig. 402: Identifying Shift Cable Bracket, Spring Clip/Washer, Control Pin, Bushing And Control Lever With Torque Specificaiton

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the spring clip/washer (B) and control pin (C), then separate the shift cable end (D) from the control lever (E).
7. Check the bushing (F) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
8. Disconnect the transmission range switch connector.
9. Pry the lock tab of the lock washer (A) on the control lever (B), and remove the nut (C), lock washer, spring washer (D) and control lever.

Fig. 403: Identifying Lock Washer, Transmission Range Switch, Control Lever, Spring Washer And Control Lever

Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Pry the lock tabs of the lock washer (E) on the transmission range switch (F), hold the control shaft (G) with a 6.0 mm wrench, and loosen the locknut (H).
11. Remove the locknut and lock washer, then remove the transmission range switch (two bolts).
12. Set the new transmission range switch (A) to the N position. The transmission range switch clicks in the N position, and the control shaft hole (B) aligns with the N position line (C).

Fig. 404: Identifying Transmission Range Switch And Control Shaft Hole

Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Move the control shaft from P to N by turning the control shaft with a 6.0 mm wrench.

Fig. 405: Identifying Control Shaft From P Position To N Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the transmission range switch (A) gently over the control shaft (B), and install the bolts loosely.

Fig. 406: Identifying Transmission Range Switch And Control Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Install the new lock washer (A) over the control shaft (B) while aligning the tab (C) of the lock washer with the N positioning line (D) on the transmission range switch (E). Then install the locknut (F).

Fig. 407: Identifying Lock Washer, Transmission Range Switch, Locknut And Control Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Push the locknut against the transmission housing to seat the transmission range switch into the control shaft, and tighten the locknut (A) to 12 N.m (1.2 kgf.m, 8.7 lbf.ft) while holding the control shaft (B) with a 6.0 mm wrench (C), then bend the lock tabs (D) of the lock washer against the locknut.

Fig. 408: Identifying Locknut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Tighten the bolts (E) to 12 N.m (1.2 kgf.m, 8.7 lbf.ft) securing the transmission range switch.
18. Install the control lever (A), spring washer (6), lock washer (C), and locknut (D) on the control shaft (E).

Fig. 409: Identifying Control Lever, Spring Washer, Lock Washer, Locknut And Control Shaft With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Check the connectors for rust, dirt, or oil, clean or repair if necessary, then connect the connector securely.
20. Apply molybdenum grease to the hole in the bushing in the shift cable end. Attach the shift cable end to the control lever, then insert the control pin into the control lever hole through the shift cable end, and secure the control pin with the spring clip/ washer.
21. Secure the shift cable bracket with the nuts.
22. Install the battery base bracket and battery base.
23. Install the air cleaner housing and intake air duct.
24. Install the under-hood subfuse box on the battery base, and install the subfuse box on its bracket.
25. Do the battery installation procedure (See **INSTALLATION**).
26. Turn the ignition switch to ON (II). Move the shift lever through all positions, and check the transmission range switch synchronization with the A/T gear position indicator.
27. Check that the engine will start in P and N, and will not start in any other shift lever position.
28. Check that the back-up lights come on when the shift lever is in R.
29. Allow all wheels to rotate freely, then start the engine, and check the shift lever operation.

TRANSMISSION GEAR SELECTION SWITCH TEST

1. Remove the driver's center console trim (see step 5 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Disconnect the transmission gear selection switch/ park pin switch/A/T gear position indicator panel light harness connector.

Fig. 410: Identifying Transmission Gear Selection Switch Connector Terminals
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between connector terminals No. 3 and No. 2.

There should be continuity when the shift lever is in M, and no continuity when the shift lever is in any position other than M.

4. Check for continuity between connector terminals No. 7 and No. 2.

There should be continuity when the shift lever is pushed toward the upshift position (+), and no continuity with the shift lever released to N.

5. Check for continuity between connector terminals No. 8 and No. 2.

There should be continuity when the shift lever is pulled toward the downshift position (-), and no continuity with the shift lever released to N. :

6. If the switch fails to work properly, replace the transmission gear selection switch and shift lever bracket base as an assembly (see **SHIFT LEVER BRACKET BASE REPLACEMENT**). The transmission gear selection switch, park pin switch, and A/T gear position indicator panel light harness are not available separately from the shift lever bracket base.
7. Install the driver's center console trim (see step 5 of **CENTER CONSOLE REMOVAL/INSTALLATION**).

TRANSMISSION GEAR SELECTION SWITCH REPLACEMENT

NOTE: The transmission gear selection switch is not available separately from the shift lever bracket base; replace the transmission gear selection switch (including park pin switch and A/T gear position indicator panel light harness) and select lever bracket base as an assembly.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Replace the transmission gear selection switch and shift lever bracket base assembly (see **SHIFT LEVER BRACKET BASE REPLACEMENT**).

A/T GEAR POSITION INDICATOR PANEL LIGHT HARNESS REPLACEMENT

NOTE: The A/T gear position indicator panel light harness is not available separately from the shift lever bracket base; replace the A/T gear position indicator panel light harness (including transmission gear selection switch and park pin switch) and select lever bracket base as an assembly.

Replace the A/T gear position indicator panel light harness and shift lever bracket base assembly (see **SHIFT LEVER BRACKET BASE REPLACEMENT**).

A/T GEAR POSITION INDICATOR PANEL LIGHT BULB REPLACEMENT

1. Remove the shift lever (see **SHIFT LEVER REMOVAL**).
2. Remove the A/T gear position indicator panel light socket from the indicator panel.
3. Remove the indicator panel light bulb from the socket, and replace the bulb with a new one.
4. Install the new bulb in the socket, and install the socket in the indicator panel.
5. Install the shift lever (see **SHIFT LEVER INSTALLATION**).

A/T INTERLOCK SYSTEM

COMPONENT LOCATION INDEX

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

CIRCUIT DIAGRAM

Fig. 412: A/T Interlock System Circuit Diagram
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING

1. Connect the HDS to the DLC.
2. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see DLC CIRCUIT TROUBLESHOOTING).

Does the shift lock solenoid work properly ?

YES - Go to step 14.

NO - Go to step 3.

3. Remove driver's center console trim (see step 4 of CENTER CONSOLE REMOVAL/INSTALLATION).
4. Disconnect the shift lock solenoid connector.
5. Turn the ignition switch to ON (II).
6. Measure the voltage between shift lock solenoid connector terminal No. 1 and body ground.

SHIFT LOCK SOLENOID CONNECTOR

Wire side of female terminals

Fig. 413: Identifying Voltage Between Shift Lock Solenoid Connector Terminal 1 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Check for a blown No. 21 (7.5 A) fuse in the under-dash fuse/relay box. If the fuse is OK, repair open or short in the wire between the shift lock solenoid connector terminal No. 1 and the under-dash fuse/relay box.

7. Shift the shift lever into P, and press the brake pedal. Do not press the accelerator.
8. Measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2 while pressing the brake pedal.

SHIFT LOCK SOLENOID CONNECTOR

Wire side of female terminals

Fig. 414: Identifying Voltage Between Shift Lock Solenoid Connector Terminals No 1 And No 2
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Go to step 10.

9. Release the brake pedal, and measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2. The shift lever must be in P.

SHIFT LOCK SOLENOID CONNECTOR

Wire side of female terminals

Fig. 415: Identifying Voltage Between Shift Lock Solenoid Connector Terminals No 1 And No 2
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair short in the wire between PCM connector terminal A2 and the shift lock solenoid.

NO - Check the shift lock mechanism. If the mechanism is OK, replace the shift lock solenoid (see **SHIFT LOCK SOLENOID TEST**).

10. Turn the ignition switch to LOCK (0).
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector A (49P).

13. Check for continuity between PCM connector terminal A2 and shift lock solenoid connector terminal No. 2.

Fig. 416: Identifying Continuity Between PCM Connector Terminal A2 And Shift Lock Solenoid Connector Terminal 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**) and recheck.

NO - Repair open in the wire between PCM connector terminal A2 and the shift lock solenoid.

14. Press the brake pedal.

Are the brake lights ON?

YES - Go to step 15.

NO - Repair faulty brake light circuit.

15. Turn the ignition switch to LOCK (0).
16. Jump the SCS line with the HDS.
17. Disconnect PCM connector A (49P).
18. Measure the voltage between PCM connector terminal A8 and body ground while pressing the brake pedal and when the brake pedal is released.

Fig. 417: Identifying Voltage Between PCM Connector Terminal A8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage while the brake pedal is pressed, and no voltage when the pedal is released?

YES - Go to step 20.

NO - Go to step 19.

19. Check for continuity between PCM connector terminal A8 and brake pedal position switch 4P connector terminal No. 2.

Fig. 418: Identifying Continuity Between PCM Connector Terminal A8 And Brake Pedal Position Switch Terminal 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**) and recheck.

NO - Repair open in the wire between PCM connector terminal A8 and the brake pedal position switch.

20. Connect PCM connector A (49P).

21. Disconnect the transmission range switch connector.
22. Turn the ignition switch to ON (II).
23. Measure the voltage between transmission range switch connector terminals No. 6 and No. 7.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 419: Identifying Voltage Between Transmission Range Switch Connector Terminals No 6 And No 7

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 28.

NO - Go to step 24.

24. Turn the ignition switch to LOCK (0).
25. Disconnect PCM connector A (49P).
26. Check for continuity between PCM connector terminal A16 and body ground.

PCM CONNECTOR A (49P)

Terminal side of female terminals

Fig. 420: Identifying Continuity Between PCM Connector Terminal A16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between PCM connector terminal A16 and the transmission range switch connector.

NO - Go to step 27.

27. Check for continuity between PCM connector terminal A16 and transmission range switch connector terminal No. 7.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

PCM CONNECTOR A (49P)

Terminal side of female terminals

Fig. 421: Identifying Continuity Between PCM Connector Terminal A16 And Transmission Range

Switch Connector Terminal No. 7

Courtesy of AMERICAN HONDA MOTOR CO., INC.

*Is there continuity?***YES** - Go to step 28.**NO** - Repair open in the wire between PCM connector terminal A16 and the transmission range switch connector.

28. Check for continuity between transmission range switch connector terminal No. 6 and body ground.

TRANSMISSION RANGE SWITCH CONNECTOR

Wire side of female terminals

Fig. 422: Identifying Continuity Between Transmission Range Switch Connector Terminal 6 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

*Is there continuity?***YES** - Substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**) and recheck.**NO** - Repair open in the wire between transmission range switch connector terminal No. 6 and ground (G101), or repair poor ground (G101).

29. Test the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).

Is the switch OK?

YES - Go to step 30.

NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

30. Connect the HDS to the DLC.

31. Check the accelerator pedal position sensor 1 in the data list with the HDS. Do not press the accelerator.

Is the accelerator pedal position sensor 1 opening 11 % and above, or the sensor 1 voltage 0.90 V and above?

YES - Check the throttle body (see **THROTTLE BODY TEST**).

NO - Substitute a known-good PCM (see **HOW TO SUBSTITUTE THE PCM**) and recheck.

KEY INTERLOCK SYSTEM CIRCUIT TROUBLESHOOTING

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repair or service.

1. Turn the ignition switch to ACCESSORY (I). The shift lever must be in P.
2. Disconnect the steering lock assembly connector.
3. Check if the ignition switch can be turned to LOCK (0).

Can the ignition switch be turned to LOCK (0)?

YES - Go to step 4.

NO - Replace the ignition key cylinder/steering lock assembly (see **STEERING COLUMN INSPECTION**).

4. Turn the ignition switch to LOCK (0).
5. Shift the shift lever into any position other than P.
6. Check for continuity between steering lock assembly connector terminal No. 3 and body ground.

STEERING LOCK ASSEMBLY CONNECTOR

Wire side of female terminals

Fig. 423: Identifying Continuity Between Steering Lock Assembly Connector Terminal No 3 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between the key interlock solenoid and the MICU.

NO - Go to step 7.

7. Remove driver's center console trim (see step 5 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
8. Disconnect transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector.
9. Check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminal No. 4 and body ground.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION
INDICATOR PANEL LIGHT CONNECTOR**

Wire side of female terminals

Fig. 424: Identifying Continuity Between Transmission Gear Selection Switch Connector Terminal 4 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair short in the wire between transmission gear selection switch/park pin switch/ A/T gear position indicator panel light connector terminal No. 4 and the MICU.

NO - Go to step 10.

10. Shift the shift lever into P.
11. Check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminals No. 1 and No. 4. Do not push the shift lever button.

**TRANSMISSION GEAR SELECTION SWITCH/
PARK PIN SWITCH/A/T GEAR POSITION
INDICATOR PANEL LIGHT CONNECTOR**

Terminal side of female terminals

Fig. 425: Identifying Continuity Between Transmission Gear Selection Switch Connector Terminals No 1 And No 4

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the park pin switch (see **PARK PIN SWITCH TEST**) and shift lever bracket base (see **SHIFT LEVER BRACKET BASE REPLACEMENT**). The park pin switch, transmission gear selection switch, and A/T gear position indicator panel light harness are not available separately from the shift lever bracket base.

NO - Go to step 12.

12. Disconnect the multiplex integrated control unit 30P connector.
13. Turn the ignition switch to ON (II).
14. Measure the voltage between multiplex integrated control unit 30P connector terminal No. 16 and body ground.

**MULTIPLEX INTEGRATED CONTROL UNIT
30P CONNECTOR**

Wire side of female terminals

Fig. 426: Identifying Voltage Between Multiplex Integrated Control Unit 30P Connector Terminal

16 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage when the shift lever is in any position other than P, and no voltage when the shift lever is in P?

YES - Substitute a known-good multiplex integrated control unit (MICU) and recheck.

NO - Repair open or short in the wire between the MICU and the transmission range switch.

SHIFT LOCK SOLENOID TEST

1. Connect the HDS to the DLC (A).

Fig. 427: Identifying Data Link Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Select the Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

NOTE: If the HDS does not communicate with the PCM, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

3. Check that the shift lever can be moved out of P when the Shift Lock Solenoid is: ON. Move the shift lever back in P, and make sure it locks with the Shift Lock Solenoid is: OFF.
4. Check that the shift lock releases when the shift lock release is pushed, and check that it locks when the shift lock release is released.
5. If the shift lock solenoid does not work properly, perform shift lock system troubleshooting (see **SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING**).

SHIFT LOCK SOLENOID REPLACEMENT

1. Remove the shift lever (see **SHIFT LEVER REMOVAL**).
2. Remove the shift lock release (A).

Fig. 428: Identifying Shift Lock Solenoid, Shift Lock Release, Shift Lock Solenoid Plunger And Harness Connector

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the shift lock solenoid (B) and harness connector (C), and replace the shift lock solenoid.
4. Apply silicone grease to joint of the new shift lock solenoid plunger (D) and shift lock stop (E).
5. Install the shift lock solenoid plunger and plunger spring (F) in the shift lock solenoid.
6. Install the new shift lock solenoid by aligning the joint of the shift lock solenoid plunger with the tip of the shift lock stop, then push the shift lock solenoid into the shift lever bracket base securely.
7. Install the shift lock solenoid connector on the shift lever bracket base.
8. Install the shift lock release.
9. Install the shift lever (see **SHIFT LEVER INSTALLATION**).

SHIFT LOCK STOP, SHIFT LOCK STOP CUSHION REPLACEMENT

1. Remove the shift lock solenoid (see **SHIFT LOCK SOLENOID TEST**).
2. Remove the shift lock stop (A) and stop cushion (B), and replace the shift lock stop or stop cushion.

Fig. 429: Identifying Shift Lock Stop And Stop Cushion
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the shift lock stop cushion on the shift lock stop.
4. Apply silicone grease to the pin (C) on the shift lever bracket base, and install the shift lock stop over the pin.
5. Install the shift lock solenoid (see **SHIFT LOCK SOLENOID TEST**).

SHIFT LOCK RELEASE REPLACEMENT

1. Remove the shift lever (see **SHIFT LEVER REMOVAL**).
2. Remove the shift lock release, and replace it.

Fig. 430: Identifying Shift Lock Release
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the shift lock release.

4. Install the shift lever (see **SHIFT LEVER INSTALLATION**).

PARK PIN SWITCH TEST

1. Remove the driver's center console trim (see step 5 of **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Disconnect the transmission gear selection switch/ park pin switch/A/T gear position indicator panel light connector.

Terminal side of male terminals

Fig. 431: Identifying Transmission Gear Selection Switch Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Shift the shift lever into P, and check for continuity between transmission gear selection switch/park pin switch/A/T gear position indicator panel light connector terminals No. 1 and No. 4.

There should be no continuity.

4. Shift out of P, and check for continuity between connector terminals No. 1 and No. 4.

There should be continuity.

5. If the park pin switch fails the test, replace the park pin switch and shift lever bracket base as an assembly (see **SHIFT LEVER BRACKET BASE REPLACEMENT**). The park pin switch, transmission gear selection switch, and A/T gear position indicator panel light harness are not available separately from the shift lever bracket base.
6. Install the driver's center console trim (see step 5 of **CENTER CONSOLE REMOVAL/INSTALLATION**).

PARK PIN SWITCH REPLACEMENT

NOTE: The park pin switch is not available separately from the shift lever bracket base; replace the park pin switch (including the transmission gear selection switch and A/T gear position indicator panel light harness) and select lever bracket base as an assembly.

Replace the park pin switch and shift lever bracket base assembly (see **SHIFT LEVER BRACKET BASE REPLACEMENT**).

TRANSMISSION DISASSEMBLY

Special Tools Required

Mainshaft holder set 07GAB-PF50101

1. Remove the ATF dipstick (D) and the dipstick tube (E).

Fig. 432: Disassembling View Of Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove A/T clutch pressure control solenoid valve A and B (six bolts), ATF feed pipes (F) (three), O-

rings (three), and gasket.

3. Remove the solenoid valve cover (G) (seven bolts), dowel pins (two), and gasket.
4. Disconnect the solenoid valve connectors, then remove the solenoid harness connector (H).
5. Remove A/T clutch pressure control solenoid valve C (four bolts), ATF feed pipes (I) (three), O-rings (two), and gasket.
6. Pry the lock tab of the lock washer (J) on the control lever (K), and remove the nut, lock washer, spring washer, and control lever.
7. Pry up the lock tabs of the lock washer (K) on the transmission range switch (L), hold the selector control shaft (M) with a 6.0 mm wrench, and loosen the locknut (N).
8. Remove the locknut and lock washer, then remove the transmission range switch (two bolts).
9. Remove the input shaft (mainshaft) speed sensor (O), output shaft (countershaft) speed sensor (P), and sensor washer (Q).
10. Remove the ATF temperature sensor connector from the connector bracket (R) and the harness clamp from the clamp bracket, then remove the ATF temperature sensor (S).
11. Remove the connector bracket (R) and 6.0 mm bolt (T), then remove the line bolts (U), ATF cooler lines (V), and sealing washers (W).
12. Remove the end cover (X) (three bolts), snap ring cap (Y) (two bolts), sealing plug (Z), and washer (AA).
13. Remove the 3rd clutch transmission fluid pressure switch (BB) and sealing washer.
14. Remove the 4th clutch transmission fluid pressure switch (CC) and sealing washer.
15. Remove the 2nd clutch transmission fluid pressure switch (DD) and sealing washer.
16. Remove the transmission ground terminal (EE).
17. Slip the mainshaft holder onto the mainshaft.

Fig. 433: Identifying Mainshaft Holder

Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Cut the lock tab(A) of the mainshaft locknut (B) using a chisel (C).

NOTE: Keep all of the chiseled particles out of the transmission.

Fig. 434: Cutting Lock Tab Of Mainshaft Locknut Using Chisel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Remove the locknut (A) from the mainshaft (B).

Fig. 435: Identifying Mainshaft Locknut And Lock Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Pry the lock washer (C), and remove it.
21. Remove the transmission housing mounting bolts (A) (23 bolts), special bolt (B), transmission hanger (C), and ground terminal bracket (D).

Fig. 436: Disassembling View Of Transmission
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. While expanding the snap ring of the countershaft bearing using the snap ring pliers, lift the transmission housing.

Fig. 437: Expanding Countershaft Bearing Snap Ring
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Release the pliers, and remove the transmission housing (E), two dowel pins (F), and gasket.
24. Remove the ATF feed pipes (G) (four) from the accumulator body.
25. Remove the ATF feed pipes (H) (two) from the torque converter housing.
26. Remove the mainshaft holder from the mainshaft.
27. Pry back the lock tab of the lock washer (I) on the shift fork (J), then remove the bolt and the lock washer.
28. Unlock the detent spring from the detent arm.

Fig. 438: Identifying Detent Spring From Detent Arm
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Remove the park pawl stop (K), park pawl (L), pawl spring (M), and pawl shaft (N).
30. Remove the mainshaft (O), countershaft (P), shift fork (J), and secondary shaft (Q) together, and remove the needle bearing (R) from the torque converter housing.

31. Remove the selector control shaft and park lever link (S).
32. Remove the baffle plate (T).
33. Remove the differential assembly (U).
34. Remove the transfer output shaft (V).
35. Remove the baffle plate (W).
36. Remove the intermediary shaft (X).
37. Remove the ATF strainer (A) (one bolt).

Fig. 440: Disassembling View Of Transmission

Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Remove the accumulator body (B) (11 bolts), dowel pins (two), detent arm (C), arm shaft (D), and separator plate (E).
39. Remove the ATF feed pipe (F) from the main valve body.
40. Remove the secondary valve body (G) (one bolt), dowel pins (two), and separator plate (H). Do not let the check balls (I) (two) fall out.

41. Remove the regulator valve body (J) (seven bolts), stator shaft (K), stator shaft stop (L), dowel pins (two), and separator plate (M).
42. Remove the main valve body (N) (8 mm: three bolts, 6 mm: seven bolts). Do not let the lubrication check valve (O) fall out.
43. Remove the torque converter check valve (P) and valve spring (Q).
44. Remove the ATF pump driven gear shaft (R), then remove the ATF pump gears (S).
45. Remove the dowel pins (two) and main separator plate (T).
46. Remove the ATF passage pipe (U).
47. Remove the ATF magnet (V), clean it, then reinstall.
48. Remove the O-ring (W) from the ATF strainer, and replace the new O-ring when reassembling the transmission.
49. Remove the O-ring (X) from the stator shaft, and replace the new O-ring when reassembling the transmission.
50. Clean the inlet opening (A) of the ATF strainer (B) thoroughly with compressed air, then check that it is good condition and the inlet opening is not clogged.

Fig. 441: Identifying Inlet Opening Of ATF Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Test the ATF strainer by pouring clean ATF through the inlet opening, and replace if it is clogged or damaged.

TRANSMISSION HOUSING

REVERSE IDLER GEAR REMOVAL/ INSTALLATION

1. Remove the reverse idler gear assembly (A) from the transmission housing.

Fig. 442: Identifying Reverse Idler Gear Assembly And Dowel Pins With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the reverse idler gear assembly with the two dowel pins (B) in the transmission housing.

REVERSE IDLER GEAR DISASSEMBLY/ INSPECTION/REASSEMBLY

1. Remove the snap ring (A), then remove the thrust washer (B), reverse idler gear (C), needle bearings (D), and thrust washer (E) from the reverse idler gear shaft/holder (F).

Fig. 443: Identifying Thrust Washer, Reverse Idler Gear, Needle Bearings And Reverse Idler Gear Shaft/Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the reverse idler gear and gear shaft for excessive wear and damage.
3. Inspect the needle bearings for galling and rough movement.

4. Install the thrust washer and needle bearings over the gear shaft.
5. Install the reverse idler gear in the direction shown.
6. Install the thrust washer, then install the snap ring to secure the idler gear.

SECONDARY SHAFT ATF FEED PIPE CAP REMOVAL

1. Cover the tip of the 1st-hold clutch ATF feed pipe with a shop rag.
2. Apply air pressure to the ATF feed pipe hole of the 1st-hold clutch pressure circuit, and remove the ATF feed pipe cap from the transmission housing.

Fig. 444: Identifying ATF Feed Pipe Cap From Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT ATF FEED PIPE CAP INSTALLATION

1. Install the new O-rings (A) on the ATF feed pipe cap (B).

Fig. 445: Identifying O-Rings On ATF Feed Pipe Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the ATF feed pipe cap in the transmission housing. Do not pinch the O-rings.

SECONDARY SHAFT ATF FEED PIPE CAP, FEED PIPE REPLACEMENT

1. Remove the ATF feed pipe cap from the transmission housing (see **SECONDARY SHAFT ATF FEED PIPE CAP REMOVAL**).
2. Remove the snap ring (A) from the feed pipe cap (B), then remove the feed pipe guide (C), O-rings (D) (E), and 1st clutch ATF feed pipe (F).

Fig. 446: Identifying Feed Pipe Cap, Feed Pipe Guide And 1st Clutch ATF Feed Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Replace the 1st clutch ATF feed pipe or 1st-hold clutch ATF feed pipe/ATF feed pipe cap assembly. The 1st-hold clutch ATF feed pipe/ATF feed pipe cap is not available separately.
4. Install the new O-ring (D) over the 1st clutch ATF feed pipe, then install the feed pipe over the 1st-hold clutch ATF feed pipe (G) while aligning the feed pipe tabs (H) with the guide in the cap.
5. Install the new O-ring (E) in the cap and feed pipe guide, then secure the guide with the snap ring.

ATF FILTER REMOVAL/INSPECTION/ INSTALLATION

1. Remove the three 6.0 mm bolts securing the ATF filter cover (A) and ATF pipe (B).

Fig. 447: Identifying ATF Filter Cover, ATF Filter, ATF Pipe And ATF Filter Cover Bolts With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the ATF pipe from the ATF filter cover, and remove the ATF filter (C) from the cover.
3. Clean the ATF filter, then check that it is in good condition, and is not clogged. Replace the ATF filter if it is clogged or damaged.
4. Install the ATF filter with the new O-ring (D) in the filter cover, and, install the ATF pipe in the cover, then install them in the transmission housing.
5. Secure the ATF filter cover with the two bolts (E), then secure the ATF pipe with the bolt (F).

MAINSHAFT BEARING REMOVAL

Special Tools Required

- Driver 07749-0010000
 - Attachment, 78 x 80 mm 07NAD-PX40100
1. To remove the mainshaft bearing, expand the snap ring with the snap ring pliers, then push the bearing out. Do not remove the snap ring unless it's necessary to clean the groove in the housing.

Fig. 448: Identifying Snap Ring With Snap Ring Pliers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT BEARING INSTALLATION

Special Tools Required

- Driver 07749-0010000
- Attachment, 78 x 80 mm 07NAD-PX40100

1. Install the bearing in the direction shown.

Fig. 449: Identifying Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Expand the snap ring with the snap ring pliers, and insert the bearing part-way into the housing.
3. Release the pliers, then push the bearing down into the housing until the snap ring snaps in place around it.

4. After installing the bearing, check that the snap ring (A) is seated in the bearing and housing groove, and that the ring end gap (B) is 0-7 mm (0-0.28 in.).

Fig. 450: Identifying Ring End Gap

Courtesy of AMERICAN HONDA MOTOR CO., INC.

INTERMEDIARY SHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing remover shaft set, 20 mm 07936-3710600
 - Bearing remover shaft handle 07936-3710100
 - Sliding hammer weight 07741-0010201
 - Driver 07749-0010000
 - Attachment, 37 x 40 mm 07746-0010200
1. Remove the intermediary shaft bearing from the transmission housing using the bearing remover shaft set (20 mm), the bearing shaft handle, and the sliding hammer weight.

Fig. 451: Identifying Intermediary Shaft Bearing From Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new bearing until it bottoms in the transmission housing using the driver and the attachment (37 x 40 mm).

Fig. 452: Identifying Intermediary Shaft Bearing Into Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PARK LEVER SHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing remover shaft, 10 mm 07936-GE00100
 - Bearing remover head, 10 mm 07936-GE00200
 - Sliding hammer weight 07741-0010201
 - Driver 07749-0010000
 - Attachment, 22 x 24 mm 07746-0010800
1. Remove the park lever shaft bearing from the transmission housing using the bearing remover head (10 mm), the bearing remover shaft (10 mm), and the sliding hammer weight.

Fig. 453: Identifying Park Lever Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new bearing until it bottoms in the transmission housing using the driver and the attachment (22 x 24 mm).

Fig. 454: Identifying Park Lever Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing remover shaft, 10 mm 07936-GE00100
- Bearing remover head, 10 mm 07936-GE00200
- Sliding hammer weight 07741-0010201
- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the control shaft bearing from the transmission housing using the bearing remover head (10

mm), the bearing remover shaft (10 mm), and the sliding hammer weight.

Fig. 455: Identifying Selector Control Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new bearing in the transmission housing using the driver and the attachment (22 x 24 mm).

Fig. 456: Identifying Selector Control Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT OIL SEAL REPLACEMENT

Special Tools Required

- Driver 07749-0010000
- Attachment, 22 x 24 mm 07746-0010800

1. Remove the oil seal from the transmission housing.

Fig. 457: Identifying Selector Control Shaft Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new oil seal in the transmission housing using the driver and the attachment (22 x 24 mm).

Fig. 458: Identifying Selector Control Shaft Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

VALVE BODY

VALVE BODY REPAIR

NOTE: Valve body repair is only necessary if one or more of the valves in a valve body do not slide smoothly in their bores. Use this procedure to free the valves.

1. Soak a sheet of #600 abrasive paper in ATF for about 30 minutes. :
2. Carefully tap the valve body so the sticking valve drops out of its bore. It may be necessary to use a small screwdriver to pry the valve free. Be careful not to scratch the bore with the screwdriver.
3. Inspect the valve for any scuff marks. Use the ATF-soaked # 600 paper to polish off any burrs that are on the valve, then wash the valve in solvent and dry it with compressed air.
4. Roll up half of the ATF-soaked #600 paper and insert it in the valve bore of the sticking valve. Twist the

paper slightly, so that it unrolls and fits the bore tightly, then polish the bore by twisting the paper as you push it in and out.

NOTE: The valve body is aluminum and doesn't require much polishing to remove any burrs.

Fig. 459: Identifying ATF-Soaked Paper In Valve Bore Of Sticking Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the #600 paper. Thoroughly wash the entire valve body in solvent, then dry it with compressed air.
6. Coat the valve with ATF, then drop it into its bore. It should drop to the bottom of the bore under its own weight. If not, repeat steps 4 and 5, then retest. If the valve still sticks, replace the valve body.

Fig. 460: Identifying Valve Into Valve Bore
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the valve, and thoroughly clean it and the valve body with solvent. Dry all parts with compressed air, then reassemble using ATF as a lubricant.

VALVE BODY VALVE INSTALLATION

1. Coat all parts with ATF before assembly.
2. Install the valves and springs in the sequence shown for the main valve body (see **MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), secondary valve body (see **SECONDARY VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), regulator valve body (see **REGULATOR VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY**), and accumulator body (see **ACCUMULATOR BODY DISASSEMBLY; INSPECTION, AND REASSEMBLY**). Refer to the following valve cap illustrations, and install each valve cap so the end shown facing up will be facing the outside of the valve body, then secure the valve cap with the valve cap clip.

Fig. 461: Identifying Valve Cap

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the valve (A) and valve spring (B) in the valve body. Push the valve spring in with a screwdriver, then install the spring seat (C).

Fig. 462: Identifying Spring Seat

Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAIN VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages.
2. Inspect the main valve body for scoring and damage.
3. Check all valves for free movement. If any fail to slide freely, refer to **VALVE BODY REPAIR** (see).
4. Coat all parts with ATF during assembly.
5. Replace the filter with a new one, and install it and the lubrication check valve in the direction shown.

Fig. 463: Exploded View Of Main Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

VALVE SPRING SPECIFICATIONS

VALVE SPRING SPECIFICATIONS

Valve Springs		Standard (New)-Unit: mm (in.)			
		Wire Diameter	O.D.	Free Length	No. of Coils
A	Torque converter check valve spring	1.1 (0.043)	8.6(0.339)	34.3(1.350)	10.1
B	Lock-up shift valve spring	1.0(0.039)	6.6 (0.260)	35.5(1.398)	18.2
C	Shift valve E spring	0.7 (0.028)	6.6 (0.260)	42.4(1.669)	17.6
D	Shift valve A spring	0.9 (0.035)	6.6 (0.260)	50.5(1.988)	23.3
E	Shift valve B spring	0.8(0.031)	6.6 (0.260)	49.1 (1.933)	21.7
F	Modulator valve spring	1.6(0.063)	10.4(0.409)	33.5(1.319)	9.8
G	CPC valve A spring	0.7 (0.028)	6.1 (0.240)	17.8(0.701)	7.9
H	Servo control valve spring	0.9 (0.035)	9.6 (0.378)	30.2(1.189)	8.4
I	Lubrication control valve spring	0.9 (0.035)	8.7 (0.343)	25.0 (0.984)	7.2
J	Lock-up timing valve spring	0.6 (0.024)	6.6 (0.260)	30.9(1.217)	11.1

K	Relief valve spring	1.0(0.039)	9.6 (0.378)	28.1 (1.106)	7.7
---	---------------------	------------	-------------	--------------	-----

ATF PUMP INSPECTION

1. Install the ATF pump drive gear (A), driven gear (B), and ATF pump driven gear shaft (C) in the main valve body (D). Lubricate all parts with ATF, and install the ATF pump driven gear with its grooved and chamfered side facing up.

Fig. 464: Identifying ATF Pump Drive Gear, ATF Pump Driven Gear Shaft And Main Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the side clearance of the ATF pump drive gear (A) and driven gear (B).

ATF Pump Gears Side (Radial) Clearance

Standard (New):

ATF Pump Drive Gear:

0.210-0.265 mm (0.0083-0.00104 in.)

ATF Pump Driven Gear:

0.070-0.125 mm (0.0028-0.0050 in.)

Fig. 465: Identifying Side Clearance Of ATF Pump Drive Gear And Driven Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ATF pump driven gear shaft. Measure the thrust clearance between the ATF pump driven gear (A) and the valve body (B) with a straight edge (C) and a feeler gauge (D).

ATF Pump Drive/Driven Gear Thrust (Axial) Clearance:

Standard (New): 0.03-0.06 mm (0.001-0.002 in.)

Service Limit: 0.07 mm (0.003 in.)

Fig. 466: Identifying Thrust Clearance Between ATF Pump Driven Gear And Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Clean all parts thoroughly insolvent, and dry them with compressed air. Blow out all passages.
2. Do not use a magnet to remove the check balls, it may magnetize the check balls.
3. Inspect the secondary valve body for scoring and damage.
4. Check all valves for free movement. If any fail to slide freely, refer to **VALVE BODY REPAIR** (see).
5. Coat all parts with ATF during assembly.

Fig. 467: Exploded View Of Secondary Valve Body
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

VALVE SPRING SPECIFICATIONS

VALVE SPRING SPECIFICATIONS

Valve Springs		Standard (New)-Unit: mm (in.)			
		Wire Diameter	O.D.	Free Length	No. of Coils
A	CPC valve C spring	0.7 (0.028)	6.1 (0.240)	17.8 (0.701)	7.9
B	Shift valve D spring	0.7 (0.028)	6.6 (0.260)	42.4 (1.669)	17.6
C	Reverse CPC valve spring	0.8 (0.031)	6.1 (0.240)	24.4 (0.961)	14.6
D	Shift valve C spring	0.8 (0.031)	6.6 (0.260)	49.1 (1.933)	21.7
E	CPC valve B spring	0.7 (0.028)	6.1 (0.240)	17.8 (0.701)	7.9
F	Reverse control valve spring	0.8 (0.031)	6.6 (0.260)	49.1 (1.933)	21.7

REGULATOR VALVE BODY DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blow out all passages.
2. Inspect the regulator valve body for scoring and damage.
3. Hold the regulator spring cap in place while removing the stop bolt. The regulator spring cap is spring loaded. Once the stop bolt is removed, release the spring cap slowly so it does not pop out.
4. Check all valves for free movement. If any fail to slide freely, refer to **VALVE BODY REPAIR** (see).
5. Coat all parts with ATF during assembly.
6. Align the hole in the regulator spring cap with the stop bolt hole, then press the spring cap into the valve body, and tighten the stop bolt.
7. Install the servo valve with the new O-ring, and 3rd accumulator piston with the new O-ring.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

E	Regulator valve spring A	1.85 (0.073)	14.7 (0.579)	86.9 (3.421)	16.2
F	Stator reaction spring	5.5 (0.217)	37.4 (1.472)	30.3 (1.193)	2.1

ACCUMULATOR BODY DISASSEMBLY; INSPECTION, AND REASSEMBLY

1. Clean all parts thoroughly in solvent, and dry them with compressed air. Blowout all passages.
2. Inspect the accumulator body for scoring and damage.
3. Coat all parts with ATF during assembly.

4. Replace the O-rings with new ones.

Fig. 469: Exploded View Of Accumulator Body
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

VALVE SPRING SPECIFICATIONS

VALVE SPRING SPECIFICATIONS

Valve Springs		Standard: (New)-Unit mm (in.)			
		Wire Diameter	O.D.	Free Length	No. of Coils
A	4th accumulator spring	3.3 (0.130)	19.6 (0.772)	39.1 (1.539)	5.8
B	2nd accumulator spring	3.1 (0.122)	19.6 (0.772)	53.4 (2.102)	7.5
C	1st accumulator spring A	2.3 (0.091)	19.6 (0.772)	60.8 (2.394)	9.5
D	1st accumulator spring B	2.5 (0.098)	12.8 (0.504)	46.0 (1.811)	9.5

SHIFT SOLENOID VALVE REMOVAL AND INSTALLATION

NOTE: Do not hold the solenoid valve connector to remove and install the shift

solenoid valve. Be sure to hold the solenoid valve body.

1. Remove the mounting bolts, then remove the solenoid valves by holding the solenoid valve body.
2. Install the new O-rings (E) on each shift solenoid valve.

NOTE: If you are installing a new shift solenoid valve, it comes with new O-rings already installed.

Fig. 470: Identifying Shift Solenoid Valves And O-Rings With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install shift solenoid valve D (black connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts the accumulator body.
4. Install shift solenoid valve A (black connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts the accumulator body.
5. Install shift solenoid valve C (brown connector) by holding the shift solenoid valve body; be sure to position the mounting bracket on top of the bracket of shift solenoid valve A.

NOTE: Do not install shift solenoid valve C before installing shift solenoid valve A. If shift solenoid valve C is installed before installing shift solenoid valve A, it may damage the hydraulic control system.

6. Install shift solenoid valve B (brown connector) by holding the shift solenoid valve body; be sure the mounting bracket contacts the accumulator body.

TORQUE CONVERTER HOUSING

MAINSHAFT BEARING AND OIL SEAL REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
 - Sliding hammer weight 07741-0010201
 - Driver 07749-0010000
 - Attachment, 62 x 68 mm 07746-0010500
 - Attachment, 72 x 75 mm 07746-0010600
1. Remove the mainshaft bearing and oil seal using the adjustable bearing remover and the sliding hammer weight.

Fig. 471: Identifying Mainshaft Bearing And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new mainshaft bearing until it bottoms in the housing using the driver (07749-0010000) and the attachment (62 x 68 mm).

Fig. 472: Identifying Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the new oil seal flush to the housing using the driver and the attachment (72 x 75 mm).

**Fig. 473: Identifying Oil Seal**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
 - Sliding hammer weight 07741-0010201
 - Driver 07749-0010000
 - Attachment, 78 x 80 mm 07NAD-PX40100
1. Remove the countershaft bearing from the torque converter housing using the adjustable bearing remover and the sliding hammer weight.

**Fig. 474: Identifying Countershaft Bearing From Torque Converter Housing**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the ATF guide plate (A) into the housing, then install the new bearing (B) in the direction shown.

Fig. 475: Identifying ATF Guide Plate And Bearing
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the bearing (A) in the housing using the driver and the attachment (78 x 80 mm); install the bearing outer notch-cut (B) in depth (C) of 0-0.03 mm (0-0.001 in.) below the housing surface (D).

Fig. 476: Identifying Countershaft Bearing
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
- Bearing remover shaft set, 30 mm 07936-8890300
- Bearing remover shaft handle 07936-3710100
- Sliding hammer weight 07741-0010201
- Driver 07749-0010000

- Attachment, 37 x 40 mm 07746-0010200
- Attachment, 62 x 68 mm 07746-0010500

1. Remove the bolt, then remove the lock washer (A) and bearing set plate (B).

Fig. 477: Identifying Lock Washer And Bearing Set Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the secondary shaft bearing from the torque converter housing using the adjustable bearing remover and the sliding hammer weight.

Fig. 478: Identifying Secondary Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ATF guide collar from the torque converter housing.

Fig. 479: Identifying ATF Guide Collar

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the 29 x 39 x 9.5 mm secondary shaft bearing from the torque converter housing using the bearing remover shaft set (30 mm), the bearing remover shaft handle, and the sliding hammer weight.

Fig. 480: Identifying Secondary Shaft Bearing

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the 29x39 x 9.5 mm bearing into the torque converter housing using the driver and the attachment (37 x 40 mm).

Fig. 481: Identifying Secondary Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the new O-rings (A) on the ATF guide collar (B), then install the guide collar in the torque converter housing.

Fig. 482: Identifying O-Rings And ATF Guide Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the bearing in the direction shown in the housing using the driver and the attachment (62x68 mm).

Fig. 483: Identifying Secondary Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Check that the bearing groove aligns with the set plate mounting surface, then install the set plate (A) by aligning it with the bearing groove.

Fig. 484: Identifying Set Plate And Lock Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the new lock washer (B) and bolt, then bend the lock tab of the lock washer against the bolt head.

INTERMEDIARY SHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable bearing puller, 25-40 mm 07736-A01000B or 07736-A01000A
- Sliding hammer weight 07741-0010201
- Driver 07749-0010000

- Attachment, 52 x 55 mm 07746-0010400
1. Remove the intermediary shaft bearing from the torque converter housing using the adjustable bearing remover and the sliding hammer weight.

Fig. 485: Identifying Intermediary Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the ATF guide plate (A), then install the new bearing (B) in the housing.

Fig. 486: Identifying ATF Guide Plate And Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Drive the bearing into the housing using the driver and the attachment (52 x 55 mm).

Fig. 487: Identifying Intermediary Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PARK LEVER SHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing remover shaft set, 12 mm 07936-1660101
 - Sliding hammer weight 07741-0010201
 - Driver 07749-0010000
 - Attachment, 22 x 24 mm 07746-0010800
1. Remove the park lever shaft bearing from the torque converter housing using the bearing remover shaft set (12 mm) and the sliding hammer weight.

Fig. 488: Identifying Park Lever Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new bearing until it bottoms in the housing using the driver and the attachment (22 x 24 mm).

Fig. 489: Identifying Park Lever Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHAFTS AND CLUTCHES

MAINSHAFT DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Remove the thrust needle bearing (A), mainshaft 5th gear (B), needle bearing (C), thrust needle bearing (D), mainshaft 5th gear collar (E), 4th/5th clutch (F), and O-rings (G) from the mainshaft (H).

Fig. 490: Identifying Mainshaft 5th Gear, Needle Bearing, Mainshaft 5th Gear Collar And 4th/5th Clutch

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the condition of the sealing rings (I). If the sealing rings are worn, distorted, or damaged, remove the set ring (J) and needle bearing (K), and replace the sealing rings with new ones.
3. Inspect the thrust needle bearing and needle bearing for wear and rough movement.
4. Inspect the splines for excessive wear and damage.
5. Inspect the 4th gear for wear and damage, and inspect the 4th gear bearing for wear and rough rotation.
6. Replace the mainshaft 4th gear (L) if the 4th gear is worn or damaged, or the bearing is worn or damaged.
7. Check the shaft bearing surfaces for scoring and excessive wear.
8. Lubricate all parts with ATF during reassembly.
9. Wrap the shaft splines with tape to prevent O-ring damage, install the new O-rings on the mainshaft, then remove the tape.
10. Install the 4th/5th clutch.
11. Install the mainshaft 5th gear collar, thrust needle bearing, needle bearing, mainshaft 5th gear, and thrust

needle bearing.

MAINSHAFT 4TH GEAR REPLACEMENT

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

1. Remove the mainshaft 4th gear (A) with the press. Place a shaft protector (B) between the press and mainshaft (C) to prevent damaging the mainshaft.

Fig. 491: Identifying Mainshaft 4th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Slide the new mainshaft 4th gear (A) over the mainshaft (B), then press it into place using the driver (40 mm I.D.) and the press.

Fig. 492: Identifying Mainshaft 4th Gear

Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT DISASSEMBLY

Exploded View

Fig. 493: Exploded View Of Countershaft With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Refer to the Exploded View as needed during the following procedure.

1. Cut the lock tab (A) off the countershaft locknut (B) using a chisel (C).

NOTE: Keep all of the chiseled particles out of the countershaft.

Fig. 494: Identifying Lock Tab Of Countershaft Locknut Using Chisel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Hold the countershaft securely with a wrench and a vise, loosen the locknut, and remove it. The locknut has left-hand threads.

Fig. 495: Identifying Countershaft Locknut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Place the countershaft 5th gear (A) on press bases (B), and place a shaft protector (C) between the countershaft (D) and the press to prevent damaging the countershaft.

Fig. 496: Identifying Countershaft Out Of Press-Fitted Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Support the bottom of the countershaft with one hand, then press the countershaft out of the press-fitted bearing (E) and the press-fitted reverse selector hub. Some reverse selector hubs are not press-fitted, and the countershaft out of the press-fitted bearing.
5. Remove the remaining parts from the countershaft.
6. Inspect the bearing for galling and rough movement.
7. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
8. Check the idler gear axial clearance and 4th gear axial clearance (see **COUNTERSHAFT IDLER GEAR AND 4TH GEAR AXIAL CLEARANCE INSPECTION**).

COUNTERSHAFT IDLER GEAR AND 4TH GEAR AXIAL CLEARANCE INSPECTION

1. Install the 40.5 mm cotters (A), 2nd gear (B), thrust needle bearing (C), needle bearing (D), idler gear (E), thrust needle bearing (F), 61 mm washer (G), 1st gear (H), 4th gear (I), 50.8 mm collar (J), 50.8 mm washer (K), 42.2 mm cotters (L), cotter retainer (M), and snap ring (N) on the countershaft (O). Install the 40.5 mm cotters, idler gear, 1st gear, and 4th gear in the direction shown.

Fig. 497: Identifying 2nd Gear, Thrust Needle Bearing, Idler Gear, Cotter Retainer, Snap Ring And Countershaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Insert a feeler gauge blade (A) as thick as possible between the 50.8 mm collar (B) and 50.8 mm washer (C).

Fig. 498: Identifying Feeler Gauge Blade Between Collar And Washer

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Set the dial indicator (A) on the idler gear (B).

Fig. 499: Identifying Dial Indicator On Idler Gear
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the idler gear axial clearance in at least three places while moving the idler gear. Use the average as the actual clearance.

Standard: 0.005-0.040 mm (0.0002-0.0016 in.)

Fig. 500: Identifying Idler Gear Axial Clearance
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the measurement is out of standard, remove the 61 mm washer and measure its thickness.
6. From the table below, select the proper washer. Then install the washer and recheck the clearance.

WASHER, 61 mm

WASHER THICKNESS SPECIFICATION

No.	Part Number	Thickness
A	90582-RJF-T00	1.525 mm (0.0600 in.)
B	90583-RJF-T00	1.505 mm (0.0593 in.)
C	90584-RJF-T00	1.485 mm (0.0585 in.)
D	90585-RJF-T00	1.465 mm (0.0577 in.)

E	90586-RJF-T00	1.445 mm (0.0569 in.)
F	90587-RJF-T00	1.425 mm (0.0561 in.)
G	90588-RJF-T00	1.405 mm (0.0553 in.)

7. Measure the clearance between the 50.8 mm collar (A) and the 50.8 mm washer (B) with a feeler gauge (C) in at least three places. Use the average as the actual clearance.

Standard: 0.005-0.040 mm (0.0002-0.0016 in.) A B

Fig. 501: Identifying Clearance Between Collar And Washer With Feeler Gauge
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. If the measurement is out of standard, remove the 50.8 mm washer and measure its thickness.
 9. From the table below, select the proper washer. Then install the washer and recheck the clearance.

WASHER, 50.8 mm

WASHER THICKNESS SPECIFICATION

No.	Part Number	Thickness
A	90519-RJF-T00	1.91 mm (0.0752 in.)

AA	90545-RJF-T00	2.43 mm (0.0957 in.)
AB	90546-RJF-T00	2.45 mm (0.0965 in.)

COUNTERSHAFT REASSEMBLY

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

1. Install the 40.5 mm cotters (A), 2nd gear (B), thrust needle bearing (C), needle bearing (D), idler gear (E), thrust needle bearing (F), 61 mm washer (G), 1st gear (H), 4th gear (I), 50.8 mm collar (J), 50.8 mm washer (K), 42.2 mm cotters (L), cotter retainer (M), and snap ring (N) on the countershaft (O). Install the 40.5 mm cotters, idler gear, 1st gear, and 4th gear in the direction shown.

Fig. 502: Identifying 2nd Gear, Thrust Needle Bearing, Idler Gear, Cotter Retainer, Snap Ring And Countershaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the thrust washer (P), needle bearing (Q) and 5th gear (R).
3. Slide the reverse selector hub (A) over the countershaft (B), then press it into place using the driver (40 mm I. D.) and the press.

NOTE: Some reverse selector hubs are not press-fitted, and can be installed without using the driver and a press.

Fig. 503: Identifying Reverse Selector Hub

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the reverse selector, reverse gear collar, needle bearing, and reverse gear over the reverse selector hub.
5. Install the ball bearing (A) over the countershaft, then press it into place using the driver (40 mm I.D.) and the press.

Fig. 504: Identifying Ball Bearing Over Countershaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the conical spring washer (A) in the direction shown, and install the new locknut (B).

Fig. 505: Identifying Conical Spring Washer And Locknut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Hold the countershaft securely with a wrench and a vise, and tighten the locknut to 167 N.m (17.0 kgf.m, 123 lbf.ft).

NOTE:

- Use a torque wrench to tighten the locknut. Do not use an impact wrench.
- The locknut has left-hand threads.

Fig. 506: Tightening Countershaft Locknut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Stake the locknut into its shaft in depth (A) of 0.7-1.3 mm (0.03-0.05 in.) using a 3.5 mm punch (B).

Fig. 507: Staking Countershaft Locknut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT DISASSEMBLY

Exploded View

Fig. 508: Exploded View Of Secondary Shaft With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

Wrench, 40 x 42 mm 07XAA-002010A

NOTE: Refer to the Exploded View as needed during the following procedure.

1. Cut the lock tab (A) off the secondary shaft locknut (B) using a chisel (C).

NOTE: Keep all of the chiseled particles out of the secondary shaft.

Fig. 509: Identifying Lock Tab Of Secondary Shaft Locknut Using Chisel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place a V-block (A) on a vise (B), and put the secondary shaft (C) on the V-block and vise.

Fig. 510: Identifying Secondary Shaft Locknut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Attach the wrench (40 x 42 mm) onto the 1st clutch guide, and secure the wrench (40 x 42 mm) with the vise to hold the secondary shaft. Loosen the locknut, and remove it. Remove any burrs from splines on

the shaft and splined washer.

4. Place the idler gear (A) on press bases (B), and place a shaft protector (C) between the secondary shaft (D) and the press to prevent damaging the secondary shaft.

Fig. 511: Identifying Secondary Shaft Out Of Press-Fitted Bearing
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Support the bottom of the secondary shaft with one hand, then press the secondary shaft out of the press-fitted bearing (E), and the secondary shaft out of the press-fitted bearing.
6. Remove the 1st/1st-hold clutch, 52 mm washer, thrust needle bearing, 1st gear assembly, needle bearings, 1st gear collar, thrust needle bearing, and idler gear.
7. Remove the 32 mm snap ring, and remove the 2nd clutch, splined washer, thrust needle bearing, needle bearing, 2nd gear/park gear, and thrust needle bearing.
8. Inspect the bearings for galling and rough movement.

NOTE: The needle bearing (A) on the 1st gear collar contains the only two no-roller cavities (B); this is normal.

Fig. 512: Identifying No-Roller Cavities Of Needle Bearing

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
10. Check the 1st gear axial clearance (see **SECONDARY SHAFT 1ST GEAR AXIAL CLEARANCE INSPECTION**), 1st gear one-way clutch (see **1st Gear One-way Clutch Inspection**), and secondary shaft installation height (see **SECONDARY SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT**).

SECONDARY SHAFT 1ST GEAR AXIAL CLEARANCE INSPECTION

Special Tools Required

- Driver, 40 mm I.D. 07746-0030100
 - Attachment, 30 mm I.D. 07746-0030300
1. Install the idler gear (A), thrust needle bearing (B), 1st gear collar (C), needle bearing (D), 1st gear assembly (E), thrust needle bearing (F), 52 mm washer (G), and 1st/1st-hold clutch (H) on the secondary shaft (I). Install the idler gear and 52 mm washer in the direction shown. Do not install the O-rings during inspection.

Fig. 513: Identifying Idler Gear, Secondary Shaft, 1st Gear Collar, Needle Bearing And 1st Gear Assembly

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the ball bearing (A) over the 1st/1st-hold clutch guide using the driver (40 mm I.D.), the attachment (30 mm I.D.), and the press.

Fig. 514: Identifying Ball Bearing

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the splined washer with the marked side up over the ball bearing in the same manner as installing the ball bearing using the driver (40 mm I.D.), the attachment (30 mm I.D.), and the press.
4. Install the old locknut and tighten it to 29 N.m (3.0 kgf.m, 22 lbf.ft).
5. Set the dial indicator (A) on the 1st clutch hub (B).

Fig. 515: Identifying Dial Indicator On 1st Clutch Hub

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the 1st gear axial clearance in at least three places while moving the 1st gear. Use the average as the actual clearance.

Standard: 0.100-0.145 mm (0.004-0.006 in.)

Fig. 516: Identifying 1st Gear Axial Clearance
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. If the measurement is out of standard, remove the washer and measure its difference.

Fig. 517: Identifying 1st Gear Axial Clearance
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Select and install a new washer, then recheck the clearance.

WASHER, 52 mm

WASHER THICKNESS SPECIFICATION

No.	Part Number	Thickness
A	90502-RWE-000	2.705 mm (0.107 in.)
B	90503-RWE-000	2.680 mm (0.106 in.)
C	90504-RWE-000	2.655 mm (0.105 in.)
D	90505-RWE-000	2.630 mm (0.104 in.)
E	90506-RWE-000	2.605 mm (0.103 in.)
F	90507-RWE-000	2.580 mm (0.102 in.)
G	90508-RWE-000	2.555 mm (0.101 in.)
H	90509-RWE-000	2.530 mm (0.100 in.)
I	90510-RWE-000	2.505 mm (0.099 in.)
J	90511-RWE-000	2.480 mm (0.098 in.)
K	90512-RWE-000	2.455 mm (0.097 in.)

L	90513-RWE-000	2.430 mm (0.096 in.)
M	90514-RWE-000	2.405 mm (0.095 in.)

1ST GEAR ONE-WAY CLUTCH INSPECTION

1. Hold the 1st-hold clutch hub (A), and turn the 1st gear (B) in the direction shown to be sure it turns freely. Also make sure the 1st gear locks in the opposite direction.

Fig. 518: Identifying 1st Gear One-Way Clutch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If any problem occurs on the 1st gear one-way clutch, replace the 1st clutch hub (C). The 1st gear one-way clutch is not available separately from the 1st clutch hub.
3. Also check the 1st gear and the 1st-hold clutch hub for wear and damage. If the 1st gear and 1st-hold clutch hub are worn or damaged, replace the damaged part, refer to **1st Clutch Hub Replacement** (see).

1ST CLUTCH HUB REPLACEMENT

Special Tools Required

- Driver 07749-0010000
 - Driver attachment 07947-6340500
 - Attachment, 78 x 90 mm 07GAD-SD40101
1. Remove the 1st-hold clutch hub (A) from 1st gear (B) using the driver, the driver attachment, and the press.

Fig. 519: Identifying 1st-Hold Clutch Hub From 1st Gear
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the 1st clutch hub (C) from 1st gear.
3. Install the new 1st clutch hub (A) over 1st gear (B), and install the 1st-hold clutch hub (C) in 1st gear.

Fig. 520: Identifying 1st Clutch Hub, 1st Gear And 1st-Hold Clutch Hub
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 1st-hold clutch hub (A) in 1st gear (B) using the driver, the attachment (78 x 90 mm), and the press.

Fig. 521: Identifying 1st-Hold Clutch Hub In 1st Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT REASSEMBLY

Special Tools Required

- Driver, 40 mm I.D. 07746-0030100
 - Attachment, 30 mm I.D. 07746-0030300
 - Wrench, 40 x 42 mm 07XAA-002010A
1. Install the thrust needle bearing (A), needle bearings (B), 2nd gear/park gear (C), thrust needle bearing (D), and splined washer (E) in the direction shown on the secondary shaft (F).

Fig. 522: Identifying 2nd Gear/Park Gear, Thrust Needle Bearing, Splined Washer And Secondary Shaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Wrap the shaft splines with tape, and install the new O-rings (G) in the 2nd clutch Oaring grooves, then remove the tape.

NOTE: To prevent damaging the O-rings, be sure to install the O-rings after installing the splined washer.

3. Install the 2nd clutch (H) on the secondary shaft, and secure the 2nd clutch with the snap ring (I).
4. Install the idler gear (A) in the direction shown, thrust needle bearing (B), 1st gear collar (C), needle bearing (D), 1st gear assembly (E), thrust needle bearing (F), and 52 mm washer (G) in the direction shown on the secondary shaft (H).

NOTE: The needle bearing contains the only two no-roller cavities (I); this is normal.

Fig. 523: Identifying Idler Gear, 1st Gear Collar, Needle Bearing, 1st Gear Assembly And Secondary Shaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Wrap the shaft splines with tape, and install the new O-rings (J) in 1st/1st-hold clutch O-ring grooves, then remove the tape.

NOTE: To prevent damaging the O-rings, be sure to install the O-rings after installing the 1st gear collar and 52 mm washer.

6. Install the 1st/1st-hold clutch (K).
7. Install the ball bearing (A) over the 1st/1st-hold clutch guide (B) using the driver (40 mm I.D.), the attachment (30 mm I.D.), and the press.

Fig. 524: Identifying Ball Bearing

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the new splined washer (A) with the marked side (B) up over the ball bearing using the driver (40 mm I.D.), the attachment (30 mm I.D.), and the press.

Fig. 525: Identifying Splined Washer

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the new locknut.

Fig. 526: Identifying Locknut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Place a V-block (A) on a vise (B), and put the secondary shaft (C) on the V-block and the vise.

Fig. 527: Identifying Secondary Shaft On V-Block And Vise

Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Attach the wrench (40 x 42 mm) onto the top of the 1st clutch guide, and secure the wrench (40 x 42 mm) with the vise to hold the secondary shaft. Tighten the locknut to 178 N.m (18.2 kgf.m, 132 lbf.ft) with the torque wrench (D).

NOTE:

- Use a torque wrench to tighten the locknut. Do not use an impact wrench.
- The locknut has left-hand threads.

12. Stake the locknut to a depth (A) of 0.7-1.3 mm (0.03-0.05 in.) using a 3.5 mm punch (B).

Fig. 528: Identifying Locknut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT

1. Install the thrust needle bearing (A) in the torque converter housing (B) in the direction shown, and install the secondary shaft assembly (C).

Fig. 529: Identifying Thrust Needle Bearing, Torque Converter Housing And Secondary Shaft Assembly

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new gasket (A) on the torque converter housing.

Fig. 530: Identifying Gasket On Torque Converter Housing
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Secondary Shaft Cutaway View D

Fig. 531: Identifying Secondary Shaft Installation Height
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the height (B) of the secondary shaft installation between the surface (C) of the gasket and the top of the ball bearing outer race (D), then note the measurement.
4. Remove the 65 mm thrust shim (A) from the transmission housing, and measure its thickness.

**Fig. 532: Identifying Thrust Shim**

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Calculate the thickness of the 65 mm thrust shim using the formula.

Formula:

65 mm Thrust Shim Thickness

= Secondary Shaft Installation Height Standard - Measurement

Secondary Shaft Installation Height Standard:

228.04-228.13 mm (8.9779-8.9815 in.)

6. Select the 65 mm thrust shim from the following table.

THRUST SHIM, 65 mm

THRUST SHIM THICKNESS SPECIFICATION

No.	Part Number	Thickness
0A	90460-RDK-000	0.80 mm (0.031 in.)
A	90461-RDK-010	0.84 mm (0.033 in.)
B	90462-RDK-010	0.88 mm (0.035 in.)
C	90463-RDK-010	0.92 mm (0.036 in.)
D	90464-RDK-010	0.96 mm (0.038 in.)
E	90465-RDK-010	1.00 mm (0.039 in.)
F	90466-RDK-010	1.04 mm (0.041 in.)
G	90467-RDK-010	1.08 mm (0.043 in.)
H	90468-RDK-010	1.12 mm (0.044 in.)
I	90469-RDK-010	1.16 mm (0.046 in.)
J	90470-RDK-010	1.20 mm (0.047 in.)
K	90471-RDK-010	1.24 mm (0.049 in.)

2008 Acura MDX

AI	90495-RDK-000	2.20 mm (0.087 in.)
AJ	90496-RDK-000	2.24 mm (0.088 in.)
AK	90497-RDK-000	2.28 mm (0.090 in.)
AL	90498-RDK-000	2.32 mm (0.091 in.)
AM	90499-RDK-000	0.76 mm (0.030 in.)

7. Install the thrust shim in the transmission housing.

INTERMEDIARY SHAFT DISASSEMBLY, INSPECTION, AND REASSEMBLY

1. Remove the 26.5 mm washer, snap ring, cotter retainer, and cotters from the intermediary shaft.

Fig. 533: Identifying Intermediary Shaft Components
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the intermediary shaft 4th gear using the press (see **INTERMEDIARY SHAFT 4TH GEAR REMOVAL**), and disassemble the shaft and gears.
3. Inspect the bearings for galling and rough movement.
4. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
5. Check the sealing rings for excessive wear and damage.
6. Check the 3rd gear axial clearance (see **INTERMEDIARY SHAFT 3RD GEAR AXIAL CLEARANCE INSPECTION**), and intermediary shaft installation height (see **INTERMEDIARY SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT**).
7. Before installing the O-rings, wrap the shaft splines with tape to prevent damaging the O-rings.
8. Lubricate all parts with ATF, and reassemble the shaft and gears.
9. Install the press-fitted 4th gear using the driver (40 mm I.D.) and the press (see **INTERMEDIARY SHAFT 4TH GEAR REMOVAL**) in the direction shown.

INTERMEDIARY SHAFT 4TH GEAR REMOVAL

1. Place 4th gear (A) on press bases (B), and place a shaft protector (C) between the intermediary shaft (D) and the press to prevent damaging the intermediary shaft.

Fig. 534: Identifying 4th Gear On Press Bases
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Support the bottom of the intermediary shaft with one hand, then press the intermediary shaft out of the press-fitted gear, and the intermediary shaft out of the press-fitted gear.
3. Remove the remaining parts from the intermediary shaft.

INTERMEDIARY SHAFT 4TH GEAR INSTALLATION**Special Tools Required**

Driver, 40 mm I.D. 07746-0030100

1. Wrap the shaft splines with tape, and install the new O-rings in the 3rd clutch O-ring grooves, then remove the tape.
2. Install the 3rd clutch, 53 mm splined washer, thrust needle bearing, needle bearing, 3rd gear, and thrust needle bearing on the intermediary shaft.
3. Install 4th gear (A) using the driver (40 mm I.D.) and the press.

Fig. 535: Identifying Intermediary Shaft 4th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 19.8 mm cotters, cotter retainer, and snap ring.
5. Install the 26.5 mm washer on the top of the intermediary shaft.

INTERMEDIARY SHAFT 3RD GEAR AXIAL CLEARANCE INSPECTION

Special Tools Required

Driver, 40 mm I.D. 07746-0030100

1. Install the 3rd clutch (A), the original thickness 53 mm splined washer (B), thrust needle bearing (C), needle bearing (D), 3rd gear (E), and thrust needle bearing (F) on the intermediary shaft (G). Do not install the O-rings during inspection.

Fig. 536: Identifying 3rd Clutch, Splined Washer, Thrust Needle Bearing, Needle Bearing And 3rd Gear

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Fig. 537: Identifying Intermediary Shaft 4th Gear

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install 4th gear (H) using the driver (40 mm I.D.) and the press.
3. Install the cotters (I), cotter retainer (J), and snap ring (K).
4. Set the dial indicator (A) on 3rd gear (B).

Fig. 538: Identifying Dial Indicator On 3rd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the 3rd gear axial clearance in at least three places while moving 3rd gear. Use the average as the actual clearance.

Standard: 0.005-0.045 mm (0.0002-0.0018 in.)

Fig. 539: Identifying 3rd Gear Axial Clearance
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the clearance is out of standard, remove the splined washer and measure its thickness.
7. Select and install a new splined washer, then recheck the clearance.

SPLINED WASHER, 53 mm

SPLINED WASHER THICKNESS SPECIFICATION

No.	Part Number	Thickness
A	90546-RDK-000	3.995 mm (0.1573 in.)
B	90547-RDK-000	4.015 mm (0.1581 in.)
C	90548-RDK-000	4.035 mm (0.1589 in.)
D	90549-RDK-000	4.055 mm (0.1596 in.)

E	90550-RDK-000	4.075 mm (0.1604 in.)
F	90551-RDK-000	4.095 mm (0.1612 in.)
G	90552-RDK-000	4.115 mm (0.1620 in.)
H	90553-RDK-000	4.135 mm (0.1628 in.)
I	90554-RDK-000	4.155 mm (0.1636 in.)
J	90555-RDK-000	4.175 mm (0.1644 in.)
K	90556-RDK-000	4.195 mm (0.1652 in.)
L	90557-RDK-000	4.215 mm (0.1659 in.)
M	90558-RDK-000	4.235 mm (0.1667 in.)
N	90559-RDK-000	4.255 mm (0.1675 in.)

INTERMEDIARY SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT

1. Install the intermediary shaft (A) in the torque converter housing, and install the original thickness 26.5 mm washer (B) on the intermediary shaft.

Intermediary Shaft installation Height:

Standard:

137.285-137.385 mm (5.40491-5.40885 in.)

Fig. 540: Identifying Intermediary Shaft In Torque Converter Housing
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

Intermediary Shaft Cutaway View

Fig. 541: Identifying Intermediary Shaft Cutaway View
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new gasket (C) on the torque converter housing.
3. Measure the height (D) of the intermediary shaft installation between the surface (E) of the gasket and the surface of the 26.5 mm washer (F).
4. If the measurement is out of standard, remove the 26.5 mm washer and measure its thickness.
5. Select and install a new washer, then recheck the installation height.

WASHER, 26.5 mm

WASHER THICKNESS SPECIFICATION

No.	Part Number	Thickness
A	90564-RDK-000	1.05 mm (0.041 in.)
B	90565-RDK-000	1.13 mm (0.044 in.)
C	90566-RDK-000	1.21 mm (0.048 in.)
D	90567-RDK-000	1.29 mm (0.051 in.)
E	90568-RDK-000	1.37 mm (0.054 in.)
F	90569-RDK-000	1.45 mm (0.057 in.)
G	90570-RDK-000	1.53 mm (0.060 in.)
H	90571-RDK-000	1.61 mm (0.063 in.)

M	90576-RDK-000	2.01 mm (0.079 in.)
N	90577-RDK-000	2.09 mm (0.082 in.)
O	9G578-RDK-000	0.97 mm (0.038 in.)

CLUTCH DISASSEMBLY

Special Tools Required

- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

1. Remove the snap ring (A) with a screwdriver (B).

Fig. 542: Removing Snap Ring

Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the 1st clutch end plate (A), 1st clutch discs (B) (5), 1st clutch wave-plates (C) (5) > disc spring (D), 1st-hold clutch plate B (E), 1st-hold clutch discs (F) (3), 1st-hold clutch wave-plates (G) (2), and 1st-hold clutch flat-plate (H) from the 1st/1st-hold clutch drum (I).

Fig. 543: Identifying Clutch Plates

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make reference marks on the clutch wave-plates.
4. Remove the clutch end plate (A), clutch discs (B) (7), clutch wave-plates (C) (3), and clutch flat-plates (D) (4) from the 2nd clutch drum (E).

Fig. 544: Identifying Clutch End Plate, Clutch Discs, Clutch Wave-Plates And Clutch Flat-Plates
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Make reference marks on the clutch wave-plates.
6. Remove the clutch end plate (A), clutch discs (B) (6), clutch wave-plates (C) (3), and clutch flat-plates (D) (3) from the 3rd clutch drum (E).

Fig. 545: Identifying Clutch End Plate, Clutch Discs, Clutch Wave-Plates And Clutch Flat-Plates

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Make reference marks on the clutch wave-plates.
8. Remove the clutch end plate (A), clutch discs (B) (5), clutch wave-plates (C) (2), clutch flat-plates (D) (3), and disc spring (E) from the 4th clutch drum (F).

Fig. 546: Identifying Clutch End Plate, Clutch Discs, Clutch Wave-Plates, Clutch Flat-Plates And Disc Spring

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Make reference marks on the clutch wave-plates.
10. Remove the clutch end plate (A), clutch discs (B) (5), clutch wave-plates (C) (2), clutch flat-plates (D) (3), and disc spring (E) from the 5th clutch drum (F).

Fig. 547: Identifying Clutch End Plate, Clutch Discs, Clutch Wave-Plates And Clutch Flat-Plates
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Make reference marks on the clutch wave-plates.
12. Install the clutch spring compressor attachments and the clutch spring compressor bolt assembly.

Fig. 548: Identifying Clutch Spring Compressor Attachments

Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Be sure the clutch spring compressor attachment (A) is adjusted to have full contact with the spring retainer (B) on the 1st, 2nd, and 4th clutches.

Fig. 549: Identifying Clutch Spring Compressor Attachment

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. If either end of the clutch spring compressor attachment is set over an area of the spring retainer that is unsupported by the return spring, the retainer may be damaged.

Fig. 550: Identifying Clutch Spring Compressor Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Set the clutch spring compressor attachment (A) on the spring retainer (B) of the 3rd and 5th clutches so the clutch spring compressor attachment works on the clutch return spring (C).

Fig. 551: Identifying Clutch Spring Compressor Attachment And Spring Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. If either end of the clutch spring compressor attachment is not set over the clutch return spring end (A), the retainer may be damaged.

Fig. 552: Identifying Clutch Spring Compressor And Clutch Return Spring End

Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Compress the return spring until the snap ring can be removed.

Fig. 553: Identifying Return Spring

Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Remove the snap ring with the snap ring pliers.

Fig. 554: Identifying Snap Ring With Snap Ring Pliers

Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Remove the clutch spring compressor attachments and the clutch spring compressor bolt assembly.
20. Remove the snap ring (A), spring retainer (B), and return spring (C).

Fig. 555: Identifying Snap Ring, Spring Retainer And Return Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Wrap a shop rag around the clutch drum, and apply air pressure to the fluid passage to remove the piston. Place a finger tip on the other passage while applying air pressure.

Fig. 556: Applying Air Pressure To Fluid Passage
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the 1st/1st-hold clutch piston (A) from the clutch drum (B), and remove the O-rings from the 1st clutch piston.

Fig. 557: Identifying 1st/1st-Hold Clutch Piston And Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Remove the 1st-hold clutch piston (A) from the 1st clutch piston (B), and remove the O-rings from the 1st-hold clutch piston.

Fig. 558: Identifying Clutch Piston And 1st Clutch Piston
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Remove the clutch piston, and remove the O-rings from the 2nd, 3rd, 4th, and 5th clutch pistons.

Fig. 559: Identifying O-rings 2nd, 3rd, 4th, And 5th Clutch Pistons
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CLUTCH INSPECTION

1. Inspect the clutch pistons and clutch piston check valves (A).

Fig. 560: Identifying Clutch Pistons And Clutch Piston Check Valves
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If the clutch piston check valve is loose or damaged, replace the clutch piston.
3. Check the spring retainer for wear and damage.
4. If the spring retainer is worn or damaged, replace it.
5. Inspect the clutch discs, clutch plates, and clutch end plate for wear, damage, and discoloration.

Clutch Discs:

Standard Thickness: 1.94 mm (0.076 in.)

Clutch Flat-plates and Clutch Wave-plates Standard Thickness:

1st Clutch: 1.6 mm (0.063 in.)

1st-hold Clutch: 1.8 mm (0.071 in.)

2nd Clutch: 1.8 mm (0.071 in.)

3rd Clutch: 1.8 mm (0.071 in.)

4th Clutch: 1.6 mm (0.063 in.)

5th Clutch: 1.6 mm (0.063 in.)

6. If the clutch discs are worn or damaged, replace them as a set. If the clutch discs are replaced, inspect the clearance between the clutch end-plate and the disc.
7. If any plate is worn, damaged, or discolored, replace the damaged plate with a new plate, and inspect the other wave-plates for a phase difference. If the clutch plate is replaced, inspect the clearance between the clutch end-plate and the disc.
8. If the clutch end plate is worn, damaged, or discolored, inspect the clutch end-plate disc clearance, then replace the clutch end plate.

CLUTCH WAVE-PLATE PHASE DIFFERENCE INSPECTION

1. Place the clutch wave-plate (A) on a surface plate, and set a dial indicator (B) on the wave-plate.

Fig. 561: Identifying Clutch Wave-Plate On Surface Plate
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Find the bottom (C) of a phase difference of the wave-plate, zero the dial indicator and make a reference mark on the bottom of the wave-plate.
3. Measure the phase differences of 1st, 1st-hold, 2nd, and 3rd clutch wave-plates.
 1. Rotate the clutch wave-plate a bout 60-degrees while holding the wave-plate by its circumference. The dial indicator should be at the top of a phase difference. Do not rotate the wave-plate while holding its surface, always rotate it by holding its circumference.

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

2. Read the dial indicator. The dial indicator reads the phase difference of the wave-plate between the bottom and top.

Standard Phase Difference:

1st Clutch: 0.17-0.30 mm (0.007-0.012 in.)

1st-hold

Clutch: 0.07-0.20 mm (0.003-0.008 in.)

2nd Clutch: 0.07-0.20 mm (0.003-0.008 in.)

3rd Clutch: 0.07-0.20 mm (0.003-0.008 in.)

3. Rotate the wave-plate about 60-degrees. The dial indicator should be at the bottom of a phase difference, and zero the dial indicator.
4. Measure the phase difference at the other two tops of the wave-plate by following steps -1 thru 3.
4. Measure the phase differences of 4th and 5th clutch wave-plates.
 1. Rotate the clutch wave-plate 5-teeth or 4-teeth while holding the wave-plate by its circumference. The dial indicator should be at the top of a phase difference. Do not rotate the wave-plate while holding its surface, always rotate it by holding its circumference.
 2. Read the dial indicator. The dial indicator reads the phase difference of the wave-plate between the bottom and top.

Standard Phase Difference:

4th Clutch: 0.07-0.20 mm (0.003-0.008 in.)

5th Clutch: 0.07-0.20 mm (0.003-0.008 in.)

3. Rotate the wave-plate 5-teeth or 4-teeth. The dial indicator should be at the bottom of a phase difference, and zero the dial indicator.
4. Measure the phase difference at the other two tops of the wave-plate by following steps 1 thru 3.
5. If two of the three measurements are within the standard, the wave-plate is OK. If two of the measurements are out of standard, replace the wave-plate.

CLUTCH CLEARANCE INSPECTION

Special Tools Required

Clutch compressor attachment 07ZAE-PRP0100

1. Inspect the clutch piston, discs, plates, and end plate for wear and damage (see **CLUTCH INSPECTION**), and inspect the clutch wave-plate phase difference (see **CLUTCH WAVE-PLATE**

PHASE DIFFERENCE INSPECTION), if necessary.

2. Install the 1st-hold clutch piston in the 1st clutch piston, and install the 1st/1st-hold clutch piston (A) in the 1st/1st-hold clutch drum (B). Do not install the O-rings on the clutch pistons during inspection.

Fig. 562: Identifying Clutch Piston And Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the 1st-hold clutch flat-plate (A), alternately install the clutch discs (B) (3) and the 1st-hold clutch wave-plates (C) (2), then install the 1st-hold clutch plate B (D) with the flat side down in the direction shown.

Fig. 563: Identifying Clutch Flat-Plate, Clutch Discs, 1St-Hold Clutch Wave-Plates And Clutch Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the 1st-hold clutch plate B-to-top disc clearance with a feeler gauge (A) while pressing the 1st-hold clutch plate B down. Take measurements in at least three places, and use the average as the actual clearance.

1st-hold Clutch Plate B-to-Top Disc Clearance:

Service Limit: 0.6-1.0 mm (0.024-0.039 in.)

Fig. 564: Identifying 1st-hold Clutch Plate B-To-Top Disc Clearance
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the clearance is out of standard, replace the 1st-hold clutch plates and discs as a set, and recheck.
6. Install the disc spring (A) on the 1st-hold clutch plate B in the direction shown. Starting with the 1st clutch wave-plate, alternately install the wave-plates (B) (5) and discs (C) (5) in the 1st clutch drum (D), then install the clutch end-plate (E) with the flat side down.

Fig. 565: Identifying Disc Spring, Wave-Plates, Clutch Drum And Clutch End-Plate
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the clutch pistons in the 2nd, 3rd, 4th, and 5th clutch drums. Do not install the O-rings on the clutch pistons during inspection.

Fig. 566: Identifying 2nd, 3rd, 4th, And 5th Clutch Drums
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Starting with the 2nd clutch flat-plate, alternately install the flat-plates (A) (4) and discs (B) (4) in the 2nd clutch drum (C), and alternately install the wave-plates (D) (3) and discs (B) (3). Install the clutch end-plate (E) with the flat side down on the top disc.

Fig. 567: Identifying Flat-Plates, Discs, 2Nd Clutch Drum, And Wave-Plates
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Starting with the 3rd clutch flat-plate, alternately install the flat-plates (A) (3) and discs (B) (3) in the 3rd clutch drum (C), and alternately install the wave-plates (D) (3) and discs (B) (3). Install the clutch end-plate (E) with the flat side down on the top disc.

Fig. 568: Identifying Flat-Plates, Discs, 3rd Clutch Drum And Wave-Plates
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the disc spring (A) in the 4th clutch drum (B) in the direction shown. Starting with the 4th clutch flat-plate, alternately install the flat-plates (C) (3) and discs (D) (3), and alternately install the wave-plates (E) (2) and discs (D) (2). Install the clutch end-plate (F) with the flat side down on the top disc.

Fig. 569: Identifying Disc Spring, 4th Clutch Drum, 4th Clutch Flat-Plate, Flat-Plates And Discs
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the disc spring (A) in the 5th clutch drum (B) in the direction shown. Starting with the 5th clutch flat-plate, alternately install the flat-plates (C) (3) and discs (D) (3), and alternately install the wave-plates (E) (2) and discs (D) (2). Install the clutch end-plate (F) with the flat side down on the top disc.

Fig. 570: Identifying Disc Spring In 5th Clutch Drum
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the snap ring with a screwdriver to secure the clutch end-plate.

Fig. 571: Identifying Snap Ring To Clutch End-Plate
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Set a dial indicator (A) on the clutch end-plate (B). A

Fig. 572: Identifying Dial Indicator On Clutch End-Plate
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Zero the dial indicator with the clutch end-plate lifted up to the snap ring (C).
15. Release the clutch end-plate to lower the clutch end-plate, then put the clutch compressor attachment on the end-plate (A).

Fig. 573: Identifying Clutch End-Plate To Lower Clutch End-Plate
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Press the clutch compressor attachment down with 150-160 N (15-16 kgf, 33-35 lbf) (B) using a force gauge, and read the dial indicator (C).
17. The dial indicator reads the clearance (D) between the clutch end-plate and top disc (E). Take measurements in at least three places, and use the average as the actual clearance.

Clearance between the Clutch End-plate and the Top Disc:

Service Limit:

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

1st Clutch: 1.15-1.35 mm (0.045-0.053 in.)

2nd Clutch: 1.05-1.25 mm (0.041-0.049 in.)

3rd Clutch: 0.9-1.1 mm (0.035-0.043 in.)

4th Clutch: 0.75-0.95 mm (0.030-0.037 in.)

5th Clutch: 0.75-0.95 mm (0.030-0.037 in.)

18. If the clearance is out of the service limit, select a new clutch end-plate from the following table.

Fig. 574: Identifying Clutch End-Plate Clearance
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1ST CLUTCH END PLATES

CLUTCH END PLATES THICKNESS SPECIFICATION

Plate No.	Part Number	Thickness
1	22551-RDK-003	3.1 mm (0.122 in.)
2	22552-RDK-003	3.2 mm (0.126 in.)
3	22553-RDK-003	3.3 mm (0.130 in.)
4	22554-RDK-003	3.4 mm (0.134 in.)
5	22555-RDK-003	3.5 mm (0.138 in.)
6	22556-RDK-003	3.6 mm (0.142 in.)
7	22557-RDK-003	3.7 mm (0.146 in.)
8	22558-RDK-003	3.8 mm (0.150 in.)
9	22559-RDK-003	3.9 mm (0.154 in.)

2ND CLUTCH END PLATES

CLUTCH END PLATES THICKNESS SPECIFICATION

Plate No.	Part Number	Thickness
1	22561-RDK-003	2.1 mm (0.083 in.)
2	22562-RDK-003	2.2 mm (0.087 in.)
3	22563-RDK-003	2.3 mm (0.091 in.)
4	22564-RDK-003	2.4 mm (0.094 in.)
5	22565-RDK-003	2.5 mm (0.098 in.)
6	22566-RDK-003	2.6 mm (0.102 in.)
7	22567-RDK-003	2.7 mm (0.106 in.)

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

8	22568-RDK-003	2.8 mm (0.110 in.)
9	22569-RDK-003	2.9 mm (0.114 in.)

3RD CLUTCH END PLATES

CLUTCH END PLATES THICKNESS SPECIFICATION

Plate No.	Part Number	Thickness
1	22591-RYF-003	2.1 mm (0.083 in.)
2	22592-RYF-003	2.2 mm (0.087 in.)
3	22593-RYF-003	2.3 mm (0.091 in.)
4	22594-RYF-003	2.4 mm (0.094 in.)
5	22595-RYF-003	2.5 mm (0.098 in.)
6	22596-RYF-003	2.6 mm (0.102 in.)
7	22597-RYF-003	2.7 mm (0.106 in.)
8	22598-RYF-003	2.8 mm (0.110 in.)
9	22599-RYF-003	2.9 mm (0.114 in.)

4TH and 5TH CLUTCH END PLATES

CLUTCH END PLATES THICKNESS SPECIFICATION

Plate No.	Part Number	Thickness
1	22571-RYF-003	2.1 mm (0.083 in.)
2	22572-RYF-003	2.2 mm (0.087 in.)
3	22573-RYF-003	2.3 mm (0.091 in.)
4	22574-RYF-003	2.4 mm (0.094 in.)
5	22575-RYF-003	2.5 mm (0.098 in.)
6	22576-RYF-003	2.6 mm (0.102 in.)
7	22577-RYF-003	2.7 mm (0.106 in.)
8	22578-RYF-003	2.8 mm (0.110 in.)
9	22579-RYF-003	2.9 mm (0.114 in.)

19. Install the new clutch end-plate, and recheck the clearance. If the thickest clutch end-plate is installed, but the clearance is still over the service limit, replace the clutch discs and plates.

CLUTCH REASSEMBLY

Special Tools Required

- Clutch spring compressor attachment 07LAE-PX40100 or 07HAE-PL50101
- Clutch spring compressor bolt assembly 07GAE-PG40200 or 07GAE-PG4020A

1. Soak the clutch discs thoroughly in ATF for a minimum of 30 minutes.

2. Install the new G-rings (A) on the 1st-hold clutch piston (B), and install the 1st-hold clutch piston in the 1st clutch piston (C).

Fig. 575: Identifying G-Rings, 1St-Hold Clutch Piston And 1St Clutch Piston
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the new O-rings (A) on the 1st clutch piston (B), and install the 1st/1st-hold clutch piston in the 1st/1st-hold clutch drum (C) while applying pressure and rotating to ensure proper seating. Do not pinch the O-ring.

Fig. 576: Identifying O-rings On 1St Clutch Piston
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the O-rings (A) on the 2nd, 3rd, 4th, and 5th clutch piston (B).

Fig. 577: Identifying O-rings On 2nd, 3rd, 4th, And 5th Clutch Piston
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the clutch pistons in the clutch drums (C) while applying pressure and rotating to ensure proper seating. Do not pinch the O-ring.
6. Install the return spring (A) and spring retainer (B), and position the snap ring (C) on the spring retainer.

Fig. 578: Identifying Return Spring, Spring Retainer, Snap Ring And Spring Retainer
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the clutch spring compressor attachments and the clutch spring compressor bolt assembly.

Fig. 579: Identifying Clutch Spring Compressor And Clutch Spring Compressor Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Be sure the clutch spring compressor attachment (A) is adjusted to have full contact with the spring retainer (B) on the 1st, 2nd, and 4th clutches.

Fig. 580: Identifying Clutch Spring Compressor And Spring Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. If either end of the clutch spring compressor attachment is set over an area of the spring retainer that is unsupported by the return spring, the retainer may be damaged.

Fig. 581: Identifying Clutch Spring Compressor Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Set the clutch spring compressor attachment (A) on the spring retainer (B) of the 3rd and 5th clutches so the clutch spring compressor attachment works on the clutch return spring (C).

Fig. 582: Identifying Clutch Spring Compressor Attachment On Spring Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. If either end of the clutch spring compressor attachment is not set over the clutch return spring end (A), the retainer may be damaged.

Fig. 583: Identifying Clutch Return Spring End

Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Compress the return spring until the snap ring can be installed.

Fig. 584: Identifying Snap Ring

Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the snap ring with the snap ring pliers.

Fig. 585: Identifying Snap Ring

Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the clutch spring compressor attachments and the clutch spring compressor bolt assembly.
15. Install the 1st-hold clutch flat-plate (A), alternately install the clutch discs (B) (3) and the 1st-hold clutch wave-plates (C) (2) in the 1st/1st-hold clutch drum (D), then install the 1st-hold clutch plate B (E) with the flat side down in the direction shown.

Fig. 586: Identifying Clutch Flat-Plate, Clutch Discs, 1st-Hold Clutch Wave-Plates And Clutch Plate

Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the disc spring (F) on the 1st-hold clutch plate B in the direction shown. Starting with the 1st clutch wave-plate, alternately install the wave-plates (G) (5) and discs (H) (5), then install the clutch end-plate (I) with the flat side down on the top disc.
17. Starting with the 2nd clutch flat-plate, alternately install the flat-plates (A) (4) and discs (B) (4) in the 2nd clutch drum (C), and alternately install the wave-plates (D) (3) and discs (B) (3). Install the clutch end-plate (E) with the flat side down on the top disc.

Fig. 587: Identifying Flat-Plates, Discs And 2nd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Starting with the 3rd clutch flat-plate, alternately install the flat-plates (A) (3) and discs (B) (3) in the 3rd clutch drum (C), and alternately install the wave-plates (D) (3) and discs (B) (3). Install the clutch end-plate (E) with the flat side down on the top disc.

Fig. 588: Identifying 3Rd Clutch Flat-Plate, Flat-Plates, Discs And 3Rd Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Install the disc spring (A) in the 4th clutch drum (B) in the direction shown. Starting with the 4th clutch flat-plate, alternately install the flat-plates (C) (3) and discs (D) (3), and alternately install the wave-plates (E) (2) and discs (D) (2). Install the clutch end-plate (F) with the flat side down on the top disc.

Fig. 589: Identifying Disc Spring, 4th Clutch Drum, 4th Clutch Flat-Plate, Flat-Plates And Discs
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the disc spring (A) in the 5th clutch drum (B) in the direction shown. Starting with the 5th clutch flat-plate, alternately install the flat-plates (C) (3) and discs (D) (3), and alternately install the wave-plates (E) (2) and discs (D) (2). Install the clutch end-plate (F) with the flat side down on the top disc.

Fig. 590: Identifying Disc Spring And 5th Clutch Drum
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Install the snap ring with a screwdriver to secure the clutch end-plate.

Fig. 591: Identifying Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION REASSEMBLY

Exploded View

Bolt Tightening Torque

6 x 1.0 mm: 12 N.m (1.2 kgf.m, 8.7 lbf.ft)

8 x 1.25 mm: 18 N.m (1.8 kgf.m, 13 lbf.ft)

2008 Acura MDX

2007-09 TRANSMISSION Automatic Transmission - MDX

Bolt Tightening Torque
6 x 1.0 mm: 12 N·m (1.2 kgf·m, 8.7 lbf·ft)
8 x 1.25 mm: 18 N·m (1.8 kgf·m, 13 lbf·ft)

Fig. 592: Exploded View Of Transmission With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

Mainshaft holder 07GAB-PF50101

1. Make sure that the ATF magnet is cleaned and installed in the torque converter housing. Clean and install the ATF magnet, if necessary.
2. Install the main separator plate and the two dowel pins on the torque converter housing. Then install the ATF pump drive gear (A), driven gear (B), and ATF pump driven gear shaft (C). Install the ATF pump driven gear with its grooved and chamfered side facing down.

Fig. 593: Identifying ATF Pump Drive Gear, Driven Gear And ATF Pump Driven Gear Shaft
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. install the torque converter check valve spring and valve in the torque converter housing.
4. Install the main valve body (seven 6 mm bolts and three 8 mm bolts). Make sure the ATF pump drive gear (A) rotates smoothly in the normal operating direction, and the ATF pump driven gear shaft (C) moves smoothly in the axial and normal operating direction.

Fig. 594: Identifying Main Valve Body
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the ATF pump drive gear and ATF pump driven gear shaft do not move smoothly, loosen the main valve body bolts. Realign the ATF pump driven gear shaft, and retighten the bolts to the specified torques, then recheck. Failure to align the ATF pump driven gear shaft correctly will result in a seized ATF pump drive gear or ATF pump driven gear shaft.
6. Install the lubrication check valve, cooler check valve and cooler check valve spring in the main valve body. Install the lubrication check valve in the direction shown in the exploded view.
7. Install the secondary separator plate and the two dowel pins on the main valve body, and install the secondary valve body (one bolt).
8. Install the two check balls in the secondary valve body.
9. Install the accumulator separator plate and the two dowel pins on the secondary valve body.
10. Position the detent arm on the accumulator separator plate, and install the detent arm shaft into the detent

arm through the separator plates to the main valve body.

11. Install the 8x62 mm ATF feed pipes in the main valve body, and install the accumulator body (11 bolts).
12. Install the regulator separator plate and the two dowel pins on the main valve body.
13. Install the stator shaft with the new O-ring, and install the regulator valve body (eight bolts).
14. Install the stator shaft stop in the main valve body.
15. Install the ATF strainer with the new O-ring (two bolts).
16. Install the ATF passage pipe (one bolt) in the torque converter housing.
17. Install the intermediary shaft (A) into the main valve body, and install the 26.5 mm washer (B) on the top of the intermediary shaft.

Fig. 595: Identifying Intermediary Shaft Into Main Valve Body With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install the transfer output shaft (C) in the torque converter housing, and install the thrust shim (D) on the top of the transfer output shaft.
19. Install the differential assembly (E) in the torque converter housing.
20. Install the baffle plate (F), and make sure the differential is clear of the baffle plate.
21. Install the baffle plate (G), and make sure the intermediary shaft is clear of the baffle plate.
22. Install the selector control shaft and the park lever link(H).
23. Assemble the mainshaft, countershaft, and secondary shaft.
24. Install the needle bearing (A) on the secondary shaft roller bearing in the torque converter housing.

Fig. 596: Identifying Needle Bearing On Secondary Shaft Roller Bearing
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Turn the shift fork shaft (B) so the large chamfered hole is facing the fork bolt hole of the shift fork.
26. Engage the shift fork (C) with the reverse selector on the countershaft, and join the mainshaft (D), countershaft (E), and secondary shaft (F), then install them in the torque converter housing and shift fork on the shift fork shaft.
27. Secure the shift fork (A) to the shift fork shaft with the lock bolt and the new lock washer (B), then bend the lock tab of the lock washer against the bolt head.

Fig. 597: Identifying Shift Fork And Lock Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Install the park pawl shaft (A), pawl spring (B), park pawl (C), and park pawl stop (D).

Fig. 598: Identifying Park Pawl Shaft, Pawl Spring, Park Pawl And Park Pawl Stop
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Align the control lever pin with the manual valve guide.

Fig. 599: Identifying Control Lever Pin With Manual Valve Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Hook the detent arm spring to the detent arm.

Fig. 600: Identifying Detent Arm Spring To Detent Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the 8 x 85 mm ATF feed pipe (A), the 8 x 151.5 mm pipes (B), and the 8 x 40 mm pipe (C) in the accumulator body.

Fig. 601: Identifying ATF Feed Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Install the 8 x 57.5 mm ATF feed pipe (A) and the 10 x 123 mm pipe (B) in the torque converter housing.

Fig. 602: Identifying ATF Feed Pipe And Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Install the two dowel pins (A) and the new gasket (B) on the torque converter housing (C).

Fig. 603: Identifying Two Dowel Pins, Gasket And Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Place the transmission housing (D) on the torque converter housing.
35. Wrap a screwdriver tip with tape to prevent damaging the reverse idler gear teeth. Engage the reverse idler gear with reverse gears by rotating the idler gear using the screwdriver.

Fig. 604: Identifying Transmission Housing On Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. While expanding the snap ring of the countershaft bearing using snap ring pliers, install the transmission housing onto the bearing part-way. Then release the snap ring pliers, and push down on the housing until it bottoms and the snap ring snaps into place in the transmission housing snap ring groove.

Fig. 605: Identifying Snap Ring Expand
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Install the transmission housing mounting bolts (21 bolts) and the bolt (A) along with the transmission hanger (B) and the transmission ground terminal bracket (C), and tighten the bolts in two or more steps in a criss-cross pattern to 44 N.m (4.5 kgf.m, 33 lbf.ft).

Fig. 606: Identifying Transmission Housing Mounting Bolts With Torque Specification With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Install and tighten the two mounting bolts (D) to 39 N·m (4.0 kgf·m, 29 lbf·ft). Keep the mounting bolts free of grease or oil.
39. Install and tighten the special bolt (E) to 64 N·m (6.5 kgf·m, 47 lbf·ft).
40. Install the mainshaft holder onto the mainshaft.

Fig. 607: Identifying Mainshaft Holder Onto Mainshaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Install the new lock washer (A) with the marked side (B) up over the mainshaft (C), and apply ATF to surfaces of the lock washer and old locknut (D).

Fig. 608: Identifying Lock Washer With Marked Side
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the old locknut, and tighten it to seat the lock washer to 178 N.m (18.2 kgf.m, 132 lbf.ft), then remove the old locknut.
43. Install the new locknut and tighten it to 176 N.m (18.2 kgf.m, 132 lbf.ft), then stake the locknut to a depth (A) of 0.7-1.3 mm (0.03-0.05 in.) using a 3.5 mm punch (B).

Fig. 609: Identifying Locknut
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Install the end cover (A), dowel pin (B), and new O-ring (C).

Fig. 610: Identifying End Cover, Dowel Pin, And New O-Ring With Torque Specifications
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Install the snap ring cap (D) with the new O-ring (E).
46. Apply thread lock sealant to the threads of the sealing plug (F), and install the sealing plug and the new sealing washer (G).
47. Install the new O-ring (E) on the solenoid harness connector (F).

Fig. 611: Identifying O-Ring And Solenoid Harness Connector With Torque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Route the solenoid harness through the transmission housing, and install the solenoid harness connector.
49. Connect the harness terminals to the solenoids:
 - RED wire connector to shift solenoid valve A.
 - ORN wire connector to shift solenoid valve B.
 - GRN wire connector to shift solenoid valve C.

- YEL wire connector to shift solenoid valve D.
50. Secure the solenoid harness connector with the bolt on the transmission housing.
 51. Install the solenoid valve cover (A) with the two dowel pins (B) and the new gasket (C), and secure it with the seven bolts.

Fig. 612: Identifying Solenoid Valve Cover, Dowel Pins, Gasket And Bolts With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Place the new gasket (A) on the solenoid valve cover, then install the 8 x 105.8 mm ATF feed pipe (B) and the 8x58.3 mm pipes (C) with their filter side into the transmission housing.

Fig. 613: Identifying Solenoid Valve Cover With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Install the new O-rings (D) over the ATF feed pipes, and install the A/T clutch pressure control solenoid valves A and B(E).
54. Install the 8 x 53 mm ATF joint pipe (A) with the filter side into its mounting hole (B).

Fig. 614: Identifying ATF Joint Pipe And Mounting Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Check the height (A) of the 8 x 53 mm ATF joint pipe (B) between the top (C) of the pipe and the solenoid valve body mounting surface (D). The height is about 7 mm (0.3 in.) If the height is over 7 mm (0.3 in.), install the pipe securely until it stops the accumulator body.

Fig. 615: Identifying Height Of ATF Joint Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Install the new gasket (A) on the transmission housing. Install the 8 x 34.5 mm ATF pipe (B) with the filter end in the transmission housing, and install the 8 x 25.5 mm ATF pipe (D).

Fig. 616: Identifying Transmission Housing And ATF Pipe With Trque Specification
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Install new O-rings (E) over the ATF joint pipes.
58. Install A/T clutch pressure control solenoid valve C.
59. Set the control shaft to N by turning the selector control shaft with a 6.0 mm wrench.

Fig. 617: Identifying Selector Control Shaft
 Courtesy of AMERICAN HONDA MOTOR CO., INC.

60. Set the transmission range switch (A) to N. The transmission range switch clicks in N, and the selector control shaft hole (B) aligns with the N positioning line (C).

Fig. 618: Identifying Transmission Range Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

61. Install the transmission range switch gently over the selector control shaft (D), and install the bolts loosely.
62. Install the new lock washer (A) over the selector control shaft (B) by aligning the tab (C) of the lock washer with the N positioning line (D) on the transmission range switch (E). Then install the locknut (F).

Fig. 619: Identifying Lock Washer, Selector Control Shaft And Lock Washer With Torque Specification
Courtesy of AMERICAN HONDA MOTOR CO., INC.

63. Push the locknut against the transmission housing to seat the range switch into the selector control shaft, and tighten the locknut to 12 N·m (1.2 kgf·m, 8.7 lbf·ft) while holding the selector control shaft with a 6 mm wrench, then bend the lock tabs against the locknut.

Fig. 620: Identifying Locknut

Courtesy of AMERICAN HONDA MOTOR CO., INC.

64. Tighten the range switch mounting bolts to 12 N.m (1.2 kgf.m, 8.7 lbf.ft).
65. Install the control lever (A), spring washer (B), lock washer (C), and locknut (D) on the selector control shaft (E).

Fig. 621: Identifying Control Lever, Spring Washer, Lock Washer, Locknut And Selector Control Shaft With Torque Specification

Courtesy of AMERICAN HONDA MOTOR CO., INC.

66. Install the new O-ring (A) on the input shaft (mainshaft) speed sensor (B), and install the input shaft (mainshaft) speed sensor.
